## 1.1 Statistical Mechanics

### Ising Model: Insight

The expression:

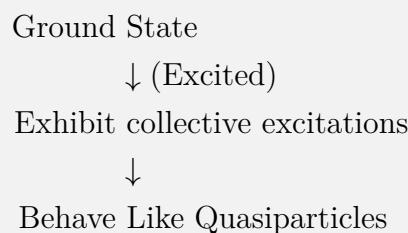

$$H = -J \sum_{\langle i,j \rangle} S_i \cdot S_j$$

is the **Hamiltonian** of a physical system.

Here,

- $H \rightarrow$  Represents the total energy of the system.
- $J \rightarrow$  This is called the **coupling constant**, that determines the interaction strength between spins.
  1. If  $J > 0$ ,  $H$  represents a system of **ferromagnetic** material ( $\uparrow\uparrow\uparrow\uparrow$ )  $\rightarrow$  Aligned in the same direction.
  2. If  $J < 0$ , it's **antiferromagnetic** ( $\uparrow\downarrow\uparrow\downarrow$ )  $\rightarrow$  Alternately aligned.

**Question:** How to know whether a system is ferro or antiferromagnetic?

### Quasiparticle

It is a collective emergent excitation in a many-body system that behaves like a particle. They are not real particles but they have energy, momentum, and spin.

### Magnons

1. Magnons are often considered quasiparticles, which are the excitation of a many-body system in ferromagnetic materials.
2. When a ferromagnetic system is disturbed from its equilibrium position, the aligned magnetic moments can wobble or oscillate around their equilibrium direction, creating a wave-like pattern of spin changes.
3. The spin waves are quantized, meaning they represent the existence of discrete packets of energy. These packets are called **Magnons**.

## Dispersion Relation

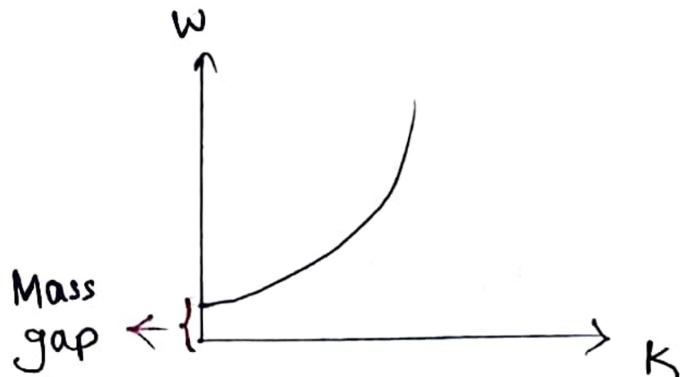

Describes the relationship between the frequency ( $\omega$ ) and the wave vector ( $k$ ) of a wave.

$$p = \hbar k, E = \hbar \omega$$

### Massive

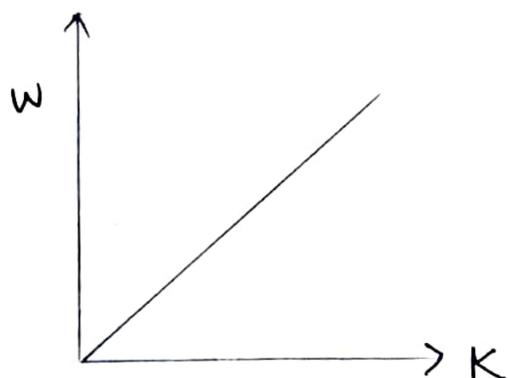

- Minimum energy required for an entity to exist comes from the equation:

$$E = mc^2, \rightarrow \text{This denotes the mass gap}$$

### Massless

- The relationship is linear.
- For photon:  $\omega = ck$
- True for every relativistic particle.

## 1.2 Quantum Mechanics

**Density matrix** is a more general property than the wave function  $\psi$  to represent or describe the state of a quantum system. It arises from an alternative interpretation of the first postulate of quantum mechanics, which asserts that  $\psi$  describes the state of a system.

## Fundamental Postulates of Quantum Mechanics:

1. Physical observables are represented by operators. Operators map to real numbers.
2. States are mathematical objects that assign real expectation values to those operators.

Conditions to be operators:

$$\omega(\mathbb{I}) = 1 \quad , \quad \omega(A^\dagger A) \geq 0$$

### Question: What is algebra?

Algebra is a mathematical structure consisting of a set equipped with one or more operations, where the operations are **defined** and the set is **closed** under those operations.

## Angular Momentum Operators:

- $[S_1, S_2] = i\hbar S_3$  (finite-dimensional representation)
- $[L_1, L_2] = i\hbar L_3$  (infinite-dimensional representation)

These are different representations of the same underlying algebraic structures, i.e., representation of a bigger space acting on different vector spaces.

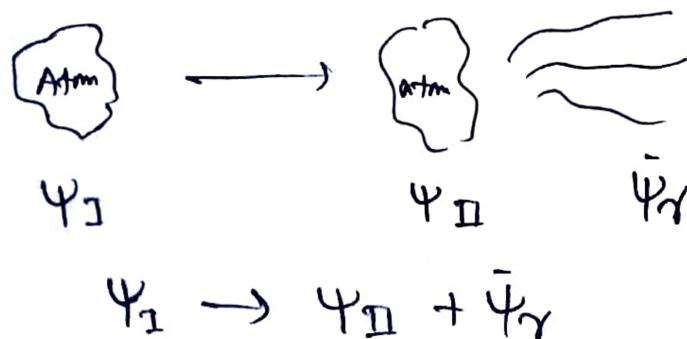

## Probability Interpretation

$\psi \rightarrow$  Probability Density

$$\int |\psi|^2 d\tau = \text{constant} = 1$$

Not always right, especially when particle number is not conserved.

This condition is violated when an atom undergoes a decay process, such as:

The conservation of total probability in such transitions implies:

$$\int |\psi_I|^2 d\tau = \int (|\psi_{II}|^2 + |\bar{\psi}_\gamma|^2) d\tau$$

**Two Cornerstones of 20th Century Physics:**

- **Special Relativity:**  $E = mc^2$
- **Quantum Mechanics:**  $\Delta p \Delta x \geq \hbar/2$

However, these two principles are not inherently compatible. For instance, taking the uncertainty principle to the limit:

$$\Delta x \rightarrow 0 \Rightarrow \Delta p \rightarrow \infty$$
$$\text{As, } \Delta E = \frac{(\Delta p)^2}{2m} \rightarrow \infty$$

Energy uncertainty generates multi-particles. This leads to new phenomena, such as particle creation, which cannot be fully explained by either theory alone — highlighting the need for **Quantum Field Theory**.

**Reading Assignments:**

## Reading Assignments:

- Von Neumann — *Mathematical Foundations of Quantum Mechanics*,  
(for mathematical formalism and axiomatic treatment.)
- Jackson — *Classical Electrodynamics*, Chapters 11 and 12

(Class-2) Lecture (-1): Sat, Apr 19, 2025

## Review of Special Relativity

- Collection of events:  $\{x\} = \mathcal{M} \rightarrow$  set of events in spacetime
- An event can be labelled by 4 coordinates:  $x^a, a = 0, 1, 2, 3$

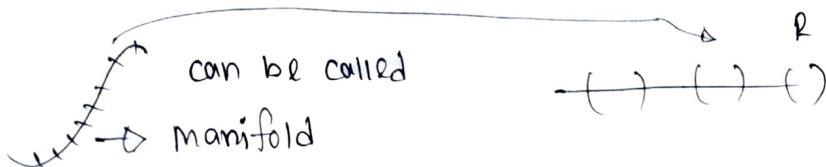

### 2.1 Manifold

Spacetime is endowed with a manifold structure  $\Rightarrow$  means that: spacetime, although it can be curved and complex on a large scale, is treated mathematically as a **manifold** — a space that, in small patches, looks like regular, flat space and time.

#### Definition

A mathematical space on which calculus can be consistently defined. It is typically covered by multiple coordinate charts (or ‘patches’) that together form an “atlas”.

$$\text{Spacetime} \rightarrow \text{Manifold } (\mathbb{R}^4)$$

Each of the local neighborhoods in a manifold is isomorphic to line segments in Euclidean space.

- **Each of the local neighborhoods:** refers to small regions around each point on the manifold.
- **Isomorphic to line segments:** means that they have the same structure, in the sense that we can map one onto the other without losing information.

On the other hand,

Because if there are ‘cuts’ in spacetime — like tears, edges or points where the structure breaks down — then spacetime isn’t a proper manifold at those points.

#### Manifold Requirements

A manifold must satisfy:

1. **Locally Euclidean:** Locally looks like flat space ( $\mathbb{R}^4$ ).
2. **Smooth or differentiable:** Calculus can be done.

**3. No breaks or cuts:** The space must be continuous and connected in a smooth way. Therefore, when there are ‘cuts’, then at those points, the spacetime fails to be a manifold because smooth coordinates can’t be defined or calculus can’t be done nicely there.

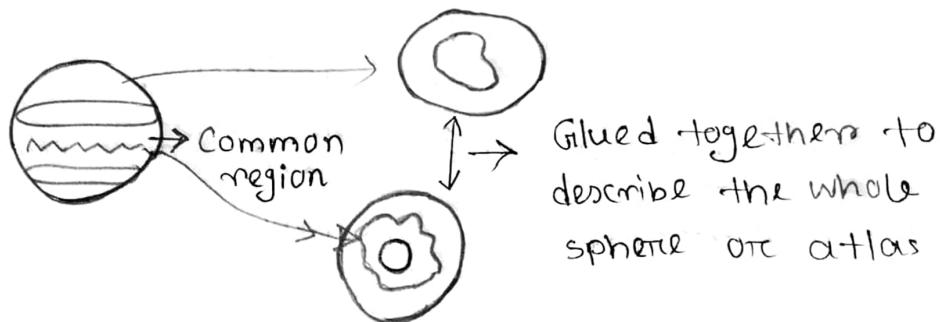

### Difference between SR and GR

- **SR** needs only one single patch. One single patch can cover everything.  
(A single patch = one coordinate system that works in a specific region of spacetime)
- **GR** needs multiple patches to cover everything.

### Example: Coordinate Patches on a Sphere

To describe a sphere (specifically a 2D sphere like the surface of the Earth), at least 2 coordinate patches (charts) are needed to smoothly cover the entire surface.

**A single coordinate system works everywhere except at the poles.**

### Extra:

In  $N$  dimensions, we need  ${}^N C_2$  angles to describe the coordinate system.

**Example:** In 10 dimensions,  ${}^{10} C_2 = 45$  angles are needed.

- ${}^{10} C_2$  because we need 2 vectors to define a plane in space.
- Rotation is defined in a plane.

**Now, the spacetime interval (or “distance-squared”) between two events:** Any distance-squared between two points in a space with some metric can be written as a bilinear form:

$$\begin{aligned} d^2(x, y) &= (x - y)^T H(x - y) \\ &= (x - y)^a \eta_{ab} (x - y)^b \\ &= [(x - y)^0]^2 - (\vec{x} - \vec{y}) \cdot (\vec{x} - \vec{y}) \end{aligned}$$

We use **East-coast convention:**

$$H \equiv \eta_{ab} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & -1 \end{bmatrix}$$

In Special Relativity (SR),  $\eta$  is fixed and globally defined. However, in General Relativity (GR), the metric becomes a function of position.

**The speed of information transfer is limited by the speed of light.**

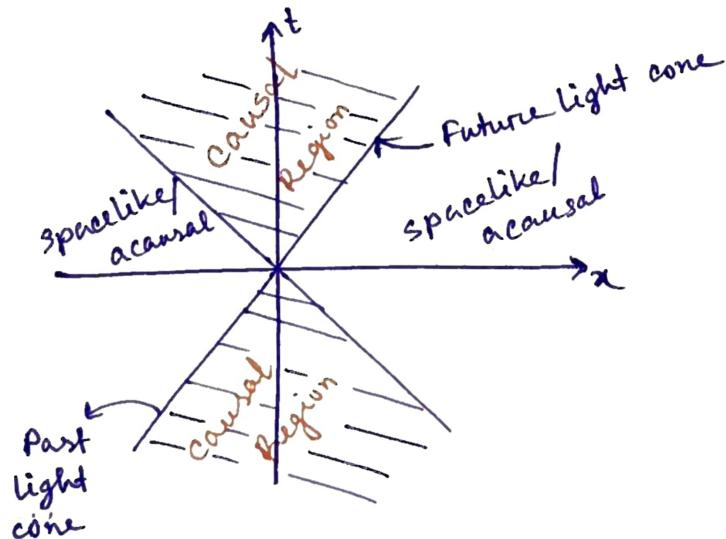

Figure: Light Cone

### Constants and Units:

$$c = 1 \Rightarrow [L] = [T]$$

$$E = mc^2 \Rightarrow E = m$$

$$\hbar = 1 \Rightarrow \lambda = \frac{\hbar}{mc} \sim \frac{1}{E}$$

$$\therefore [M], [L], [T] \equiv E, \frac{1}{E}, \frac{1}{E}$$

**By convention, we will measure everything in energy scales.**

### Postulate 1 :

Laws of nature must be such that all (... <sup>a</sup>) observers <sup>b</sup> will experience the same causal phenomena.

<sup>a</sup>Something else will sit here

<sup>b</sup>One who records—always tied to the coordinate system.

This postulate implies that laws must be written using **tensors** (they are independent of the coordinate system).

### Galilean Transformations:

$$x' = x - vt$$

- In frame  $S \Rightarrow m \frac{d^2x}{dt^2} = f = ma$
- In frame  $S' \Rightarrow m \frac{d^2x'}{dt'^2} = f'$

Under the assumptions:  $t' = t, m' = m$

And, since  $x' = x - vt$ ,

$$\begin{aligned} f' &= m \frac{d^2x'}{dt'^2} \\ &\Rightarrow f' = m \frac{d^2(x - vt)}{dt^2} \\ &\Rightarrow f' = m \frac{dv}{dt} \quad [\because \frac{d^2}{dt^2}(-vt) = 0] \\ &\Rightarrow f' = ma \\ &\therefore f' = f \end{aligned}$$

This invariance is a “symmetry” of the Newtonian laws.

### Lorentz Transformations

Lorentz transformations are linear transformations that keep the “distance squared” unchanged.

$$d^2(x) = x^T H x$$

$$x^a \rightarrow x'^a = \Lambda^a_b x^b \quad [\text{not } \Lambda^a_b x^b]$$

$$\begin{pmatrix} x'^0 \\ x'^1 \\ x'^2 \\ x'^3 \end{pmatrix} = \begin{pmatrix} \Lambda^0_0 & \Lambda^0_1 & \Lambda^0_2 & \Lambda^0_3 \\ \Lambda^1_0 & \Lambda^1_1 & \Lambda^1_2 & \Lambda^1_3 \\ \Lambda^2_0 & \Lambda^2_1 & \Lambda^2_2 & \Lambda^2_3 \\ \Lambda^3_0 & \Lambda^3_1 & \Lambda^3_2 & \Lambda^3_3 \end{pmatrix} \begin{pmatrix} x^0 \\ x^1 \\ x^2 \\ x^3 \end{pmatrix}$$

### Rotations

$$\text{If } x = \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix}, \text{ then: } x^T = (x_1 \ x_2 \ x_3)$$

Hence:

$$x^T x = (x_1 \ x_2 \ x_3) \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = x_1^2 + x_2^2 + x_3^2 = r^2$$

Now, under rotation:

$$x \rightarrow x' = Rx$$

Then,

$$\begin{aligned}(x')^T x' &= (Rx)^T (Rx) \\ &= x^T R^T Rx \\ &= x^T x\end{aligned}$$

Therefore:

$$\therefore [R^T R = R^T \mathbb{I} R = \mathbb{I}]$$

Similarly, under Lorentz transformation:

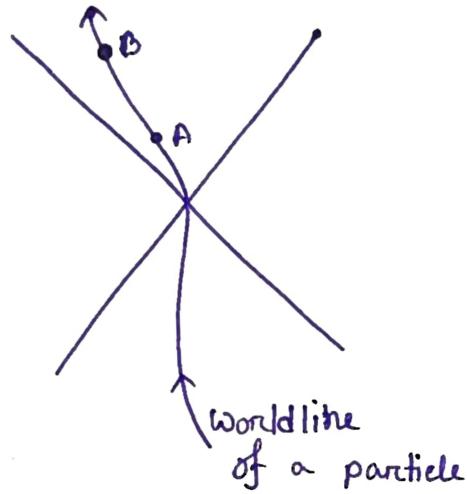

$$\begin{aligned}d^2(x') &= x'^T H x' \\ &= (\Lambda x)^T H (\Lambda x) \\ &= x^T \Lambda^T H \Lambda x \\ &= x^T H x\end{aligned}$$

$$\therefore [\Lambda^T H \Lambda = H]$$

Just as  $R^T R = \mathbb{I}$  defines orthogonal transformations,  $\Lambda^T H \Lambda = H$  defines Lorentz transformations.

$[R^T R = I] \subset [\Lambda^T H \Lambda = H]$  are the examples of classical groups.

## Dynamics

- Let  $A \rightarrow x = (x^0, x^1, x^2, x^3)$
- $B \rightarrow x + dx = (x^0 + dx^0, \dots, x^3 + dx^3)$

Hence,

$$d^2(A, B) = (dx^0)^2 - d\vec{x} \cdot d\vec{x} = d\tau^2$$

For a comoving observer, we have

$$d\vec{x} = 0$$

$$\text{thus: } d\tau^2 = (dx^0)^2$$

**(Time dilation simply arises from this equation)**

- If  $d^2(A, B) \rightarrow \text{constant}$  (let it be 10), then:

$$d\tau^2 \rightarrow 10 \quad (\text{comoving}) \quad [ \because d\vec{x} \cdot d\vec{x} = 0 ]$$

- If not comoving, say  $d\vec{x} \cdot d\vec{x} = 3$ , then to keep  $d^2(A, B) = 10$ , we need to have:

$$(dt)^2 = d^2(A, B) + d\vec{x} \cdot d\vec{x} = 10 + 3 = 13$$

$$\text{Thus, } (dt)^2 \neq (d\tau)^2$$

### Proper Time ( $\tau$ )

$\tau$  = Time measured by an observer moving along the worldline  
 $=$  Time measured by a co-moving observer

$$\begin{aligned} d\tau^2 &= dt^2 - d\vec{x} \cdot d\vec{x} \\ \Rightarrow 1 &= \left( \frac{dt}{d\tau} \right)^2 - \left( \frac{d\vec{x}}{d\tau} \right)^2 \\ &\quad \left[ \text{here, } u^a = \left( \frac{dt}{d\tau}, \frac{d\vec{x}}{d\tau} \right) \right] \\ \Rightarrow u^a u_a &= u \cdot u = 1 \end{aligned}$$

As we know,

$$u \cdot u \begin{cases} > 0 &; \text{ Timelike } \\ < 0 &; \text{ Spacelike } \\ = 0 &; \text{ Lightlike } \end{cases}$$

Then:

$$u \cdot u = 1 \quad \therefore \text{4-velocity is timelike}$$

### Significance

1. The worldline of a massive object always stays inside the light cone — it can never go faster than light.
2. The object is always moving forward in time according to its own clock.
3. If it were spacelike, that would imply faster-than-light motion.

Now,  $u \cdot u = 1$

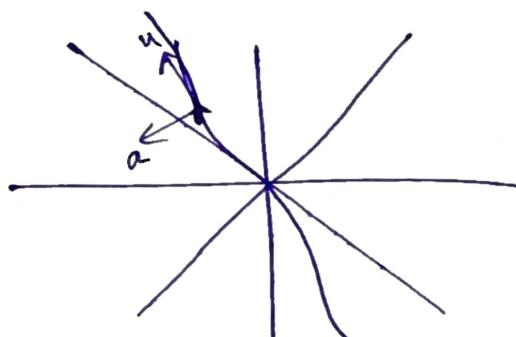

$$\Rightarrow \frac{du^a}{dt} u_a + \frac{du_a}{dt} u^a = 0$$

$$\Rightarrow \frac{du^a}{dt} u_a = 0$$

$$\Rightarrow a^b u_b = 0$$

$\Rightarrow$  4-acceleration  $\perp$  4-velocity

$\therefore$  4-acceleration is spacelike

**Significance:**

1. It is not contributing to your time flow.
2. It changes spatial direction through spacetime.
3. The 4-acceleration only bends the path, it doesn't speed up or slow down in the time direction.

**Lorentz Force**

Relativistic generalization of Newton's second law:

$$f^b = ma^b \quad (\text{Four-force})$$

In an electromagnetic field:

$$\begin{aligned} a^b &= F_c^b u^c \\ \Rightarrow a_b &= F_{bc} u^c \quad [\text{Lowering the index}] \\ \Rightarrow a_b u^b &= F_{bc} u^b u^c \quad [\text{Contracting with } u^b] \\ \Rightarrow F_{bc} u^b u^c &= 0 \quad [\text{Since } a^b u_b = 0] \\ \Rightarrow F_{bc} u^b u^c + F_{bc} u^b u^c &= 0 \\ \Rightarrow F_{bc} u^b u^c + F_{cb} u^c u^b &= 0 \\ \Rightarrow F_{bc} u^b u^c + F_{cb} u^b u^c &= 0 \quad \{\because [u^b, u^c] = 0\} \\ \Rightarrow (F_{bc} + F_{cb}) u^b u^c &= 0 \\ \therefore F_{bc} &= -F_{cb} \end{aligned}$$

**The field strength tensor is antisymmetric.**

The classical (3-vector) form of the Lorentz force law:

$$m\vec{a} = q(\vec{E} + \vec{v} \times \vec{B})$$

Relativistic form:

$$m \frac{du^a}{d\tau} = q F_a^b u^b$$

Field strength tensor  $F^{ab}$ :

$$F^{ab} \equiv \begin{bmatrix} 0 & -E_x & -E_y & -E_z \\ E_x & 0 & -B_z & B_y \\ E_y & B_z & 0 & -B_x \\ E_z & -B_y & B_x & 0 \end{bmatrix}$$

**Action Principle**

Action,  $S \Rightarrow \delta S = 0$  [minimum]

(Observer independent)

↓ consequence

Euler-Lagrange (EL) equations.

**The action should be invariant under coordinate transformation.**

$$\begin{aligned} S &\propto \text{proper length of worldline} \\ \Rightarrow S &\propto \int d\tau \\ \Rightarrow S &= m \int d\tau \end{aligned}$$

(where  $m$  is not relativistic mass, no relativistic mass exists.)

**Action must be scalar, no change will happen under transformation.**

### Dimensional Analysis of Action:

- $S$  is dimensionless
- $d\tau$  has units of length
- $m$  has units of inverse length

$$\begin{aligned} S[x] &= m \int \sqrt{\eta_{ab} dx^a dx^b} = m \int d\tau \\ &= m \int \sqrt{\eta_{ab} \frac{dx^a}{d\lambda} \frac{dx^b}{d\lambda}} d\lambda \rightarrow (\text{Reparameterization invariant}) \end{aligned}$$

( $d\lambda$  can be any time, not necessarily just proper time)

**HW:** Derive the Euler–Lagrange equations corresponding to this action (Note: The Hamiltonian of this system is zero.)

### Solving the HW problem:

Given, the action

$$A[x(s)] = m \int_{s_1}^{s_2} \sqrt{\eta_{ab} \frac{dx^a}{ds} \frac{dx^b}{ds}} ds$$

Where the Lagrangian:

$$\mathcal{L}(\dot{x}^a, \dot{x}^b) = m \left( \eta_{ab} \dot{x}^a \dot{x}^b \right)^{1/2}$$

Now, consider a variation in  $x(s)$ :

$$x(s, \epsilon) = x(s, 0) + \epsilon \eta(s)$$

with the boundary condition:

$$\eta(s_1) = \eta(s_2) = 0 \quad [\text{end points}]$$

Therefore, the variation in the action is:

$$\begin{aligned}\delta A &= \delta \int_{s_1}^{s_2} \mathcal{L}(\dot{x}^a(s), \dot{x}^b(s)) ds \\ \Rightarrow \delta A &= m \int_{s_1}^{s_2} \left( \frac{\partial \mathcal{L}}{\partial \dot{x}^a} \frac{\partial \dot{x}^a}{\partial \epsilon} d\epsilon + \frac{\partial \mathcal{L}}{\partial \dot{x}^b} \frac{\partial \dot{x}^b}{\partial \epsilon} d\epsilon \right) ds \\ \Rightarrow \delta A &= m \int_{s_1}^{s_2} \left[ \frac{\dot{x}^a}{\sqrt{\dot{x}^b \dot{x}_b}} \frac{\partial^2 x^a}{\partial \epsilon \partial s} d\epsilon + \frac{\dot{x}^b}{\sqrt{\dot{x}^a \dot{x}_a}} \frac{\partial^2 x^b}{\partial \epsilon \partial s} d\epsilon \right] ds \\ \Rightarrow \delta A &= m \int_{s_1}^{s_2} \left[ \frac{\dot{x}^a}{\sqrt{\dot{x}^b \dot{x}_b}} \frac{\partial^2 x^a}{\partial \epsilon \partial s} d\epsilon + \frac{\dot{x}^b}{\sqrt{\dot{x}^a \dot{x}_a}} \frac{\partial^2 x^b}{\partial \epsilon \partial s} d\epsilon \right] ds\end{aligned}$$

Now using integration by parts:

$$\begin{aligned}\delta A &= m \left\{ \left[ \frac{\dot{x}^a}{\sqrt{\dot{x}^b \dot{x}_b}} \frac{\partial x^a}{\partial \epsilon} \right]_{s_1}^{s_2} - \int_{s_1}^{s_2} \frac{d}{ds} \left( \frac{\dot{x}^a}{\sqrt{\dot{x}^b \dot{x}_b}} \right) \frac{\partial x^a}{\partial \epsilon} d\epsilon \right. \\ &\quad \left. + \left[ \frac{\dot{x}^b}{\sqrt{\dot{x}^a \dot{x}_a}} \frac{\partial x^b}{\partial \epsilon} \right]_{s_1}^{s_2} - \int_{s_1}^{s_2} \frac{d}{ds} \left( \frac{\dot{x}^b}{\sqrt{\dot{x}^a \dot{x}_a}} \right) \frac{\partial x^b}{\partial \epsilon} d\epsilon \right\} ds\end{aligned}$$

Since  $\eta(s_1) = \eta(s_2) = 0$ , boundary terms vanish:

$$\delta A = m \left[ - \int_{s_1}^{s_2} \frac{d}{ds} \left( \frac{\dot{x}^a}{\sqrt{\dot{x}^b \dot{x}_b}} \right) \frac{\partial x^a}{\partial \epsilon} d\epsilon - \int_{s_1}^{s_2} \frac{d}{ds} \left( \frac{\dot{x}^b}{\sqrt{\dot{x}^a \dot{x}_a}} \right) \frac{\partial x^b}{\partial \epsilon} d\epsilon \right] ds$$

If  $a = b$  then ,

$$\delta A = m \left[ -2 \int_{s_1}^{s_2} \frac{d}{ds} \left( \frac{\dot{x}_a}{\sqrt{\dot{x}^b \dot{x}_b}} \right) \frac{\partial x^a}{\partial \epsilon} d\epsilon ds \right]$$

if  $a \neq b$  , two integrands are separately zero. Therefore, for the action to be minimum i.e. to be zero, the integrands must be zero. Hence, we get the Euler-Lagrange equation:

$$\boxed{m \frac{d}{ds} \left( \frac{\dot{x}_a}{\sqrt{\dot{x}^b \dot{x}_b}} \right) = 0}$$

(Class-3) Lecture 0: Thrs, Apr 24, 2025

**Preliminary QFT****3.1 Action for a Point Particle (Massive)**

The action is given by

$$S = m \int d\tau \quad (1)$$

where  $d\tau$  can be anything, just with respect to a comoving observer.

Expanding,

$$\begin{aligned} S &= m \int \sqrt{\eta_{ab} dx^a dx^b} \\ &= m \int \sqrt{\eta_{ab} \frac{dx^a}{d\lambda} \frac{dx^b}{d\lambda}} d\lambda && \text{where, } \lambda : \text{ personal time (subjective)} \\ &= \int \mathcal{L}(x, \dot{x}) d\lambda && \tau : \text{ objective time} \end{aligned} \quad (2)$$

Now,

$$\int_a^b dy = y(b) - y(a)$$

represents coordinates  $dy$  can also be written as

$$dy = \frac{df}{dy} dy$$

Therefore it is geometrical in nature and hence reparameterization invariant.

From equation (2), the conjugate momenta will be -

$$\begin{aligned} p_a &= \frac{\partial \mathcal{L}}{\partial \dot{x}^a} && (3) \\ \Rightarrow p_a &= \frac{\partial}{\partial \dot{x}^a} \left[ m \sqrt{\eta_{ab} \dot{x}^a \dot{x}^b} \right] \\ \Rightarrow p_a &= m \frac{(\eta_{ab} \dot{x}^b + \eta_{ab} \dot{x}^a \delta^b_a)}{2\sqrt{\dot{x}^b \dot{x}_b}} \\ [\because \frac{\partial \dot{x}^b}{\partial \dot{x}^a} &= \delta^b_a] \\ \Rightarrow p_a &= m \frac{(\dot{x}_a + \dot{x}_a)}{2\sqrt{\dot{x}^b \dot{x}_b}} \\ \therefore p_a &= \frac{m \dot{x}_a}{\sqrt{\dot{x}^b \dot{x}_b}} && (4) \end{aligned}$$

**Note: How are  $p$  and  $v$  related?**The trivial answer is  $p = mv$ , but more generally,

$$p_a = \frac{\partial \mathcal{L}}{\partial \dot{x}^a}.$$

Here,  $p_a$  is the cotangent vector, i.e., the dual of the tangent vector  $(\dot{x}^a)$ .

Now, the Hamiltonian is:

$$\begin{aligned}
 H &= p_a \dot{x}^a - \mathcal{L} \\
 &= \frac{m \dot{x}_a}{\sqrt{\dot{x}^b \dot{x}_b}} \dot{x}^a - m \sqrt{\dot{x}_c \dot{x}^c} \\
 &= \frac{mr^2}{\sqrt{r^2}} - m \sqrt{r^2} \quad [:: \dot{x}_a \dot{x}^a = r^2] \\
 &= m \sqrt{r^2} - m \sqrt{r^2} \\
 &= 0
 \end{aligned}$$

### Significance:

As the Hamiltonian is the generator of time, and for this system it is zero implies that the worldline is fixed. The history of the particle (i.e., the trajectory) is known. There is no evolution of the system, no dynamics of the system. Only spacetime exists. Dynamics is the construction of spacetime itself in our head.

### Equation of Motion and Phase Space

The hallmark difference between Hamilton's and Lagrangian's equations of motion is that Hamilton's equations are first order in time, whereas those of Lagrange's are second order in time.

Example:

1.

$$\frac{d\vec{S}}{d\tau} = \mu \vec{S} \times \vec{B} \longrightarrow \text{Hamilton's equation of motion, first order in time.}$$

And the Hamiltonian is:

$$H = \frac{1}{2\mu} S_a S^a$$

Here,  $\{s\} \rightarrow$  The set of all spin components constitute the phase space. In the cross-product, there are 3 components and so, the phase space is 3-dimensional.

2. Similarly, the phase space constituted by  $x$  and  $p$  is 2-dimensional because

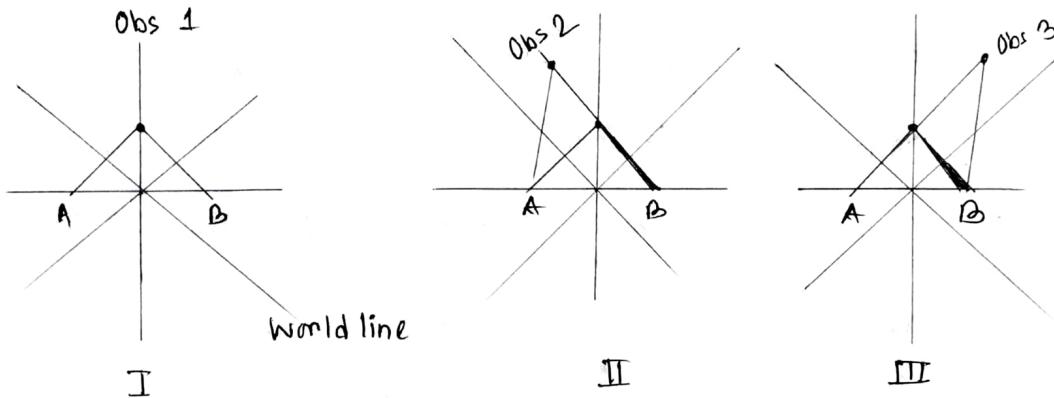

$$\frac{dx}{dt} = \{x, H\}_{\text{PB}} \quad \text{and} \quad \frac{dp}{dt} = \{p, H\}_{\text{PB}}$$

3. Also, in the Heisenberg picture,

$$\frac{dA}{dt} = \frac{1}{i\hbar} [H, A] \quad (\text{three such equations})$$

### Fun Fact: Relativity of Simultaneity

It is the concept that distant simultaneity—whether two spatially separated events occur at the same time—is not absolute but depends on the observer's reference frame.

- The physical laws are always observer independent.
- But the order of events, i.e., the **history** is observer dependent
- In picture-I: For observer 1, both events A and B happen simultaneously.
- In picture-II: A happens first, then B.
- In picture-III: B happens first, then A.

$\therefore$  Simultaneity is not a covariant statement.

### Back to the point particle

As we know,

$$p_a = \frac{\partial \mathcal{L}}{\partial \dot{x}^a} = \frac{m\dot{x}_a}{\sqrt{\dot{x}^b \dot{x}_b}}$$

It might seem that, as in  $\dot{x}^a$  there are 4 components, so will be  $p_a$ . But it's not. The system may seem unconstrained, but it's not!

$$p^a p_a = \frac{m\dot{x}^a}{\sqrt{\dot{x}^b \dot{x}_b}} \times \frac{m\dot{x}_a}{\sqrt{\dot{x}^b \dot{x}_b}} = \frac{m^2 \dot{x}^a \dot{x}_a}{(\dot{x}^b \dot{x}_b)} = \frac{m^2 r^2}{(\sqrt{r^2})^2} = m^2$$

Thus,

$$\begin{aligned} p^a p_a &= m^2 \\ \therefore p^2 &= m^2 \end{aligned} \tag{5}$$

### How to quantize a system:

In an unconstrained (and Cartesian) system,

$$p_i \leftrightarrow -i \partial_i, \quad [\hbar = 1] \quad (\text{In Schrödinger picture})$$

This is intimately connected to the coordinate system and works only in Cartesian. Moreover, this correspondence is not unique: Adding  $G(x)$  doesn't change the system, as  $[\hat{x}_i, \hat{p}_j] = i$  still works.

So, to satisfy  $[\hat{x}_i, \hat{p}_j] = i$ , it's a realization that

$$p_i \rightarrow -i\partial_i$$

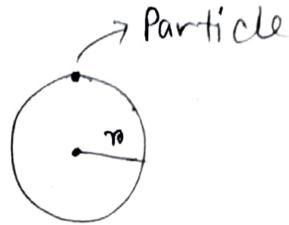

### Dirac's quantization procedure for constrained systems

1. Start with classical system, with constraints, e.g.,  $\phi(q, p) = 0$ .
2. Promote variables to operators:  $q \rightarrow \hat{q}$ ,  $p \rightarrow \hat{p}$ .
3. Promote constraints too:  $\phi(q, p) \rightarrow \hat{\phi}(\hat{q}, \hat{p})$
4. Impose constraints on states:

$$\hat{\phi}|\psi\rangle = 0$$

This will tell which quantum systems are physical.

### Example 1: Particle on a Circle

For a particle on a circle, we can immediately write the Lagrangian of the system:

$$L = T - V(x, y) = \frac{1}{2}m(\dot{x}^2 + \dot{y}^2) - V(x, y) \quad (6)$$

Now, following the procedures:

1. Constraint:  $\phi(x, y) = x^2 + y^2 - r^2 = 0$
2. Promoting variables to operators:

$$x \rightarrow \hat{x}, \quad y \rightarrow \hat{y}, \quad p \rightarrow \hat{p}_i = -i\partial_i$$

3. Similar with constraint:

$$\phi(x, y) \rightarrow \hat{\phi}(\hat{x}, \hat{y}) = \hat{x}^2 + \hat{y}^2 - r^2 = 0$$

Also, to incorporate the constraint into the Lagrangian, we need Lagrange's multiplier, i.e.,

$$L = \frac{1}{2}m(\dot{x}^2 + \dot{y}^2) - V(x, y) + \lambda(\neq x, y)(\dot{x}^2 + \dot{y}^2 - m^2)$$

(**Note:**  $\lambda$  is not a function in this case.)

- If  $\lambda$  is a function of  $(x, y)$ , then the derivative of it needs to be considered too. But we want no dynamics of the system due to this multiplier. In that case,

$$\frac{\partial \mathcal{L}}{\partial \lambda} = 0$$

Hence,  $p = 0$ , no evolution due to  $\lambda$  exists!

4. Therefore, Hamiltonian will be:

$$\begin{aligned} H &= \frac{1}{2m} (p_x^2 + p_y^2) + V(x, y) \\ \hat{H} &= \frac{1}{2m} (\hat{p}_x^2 + \hat{p}_y^2) + \hat{V}(x, y) \\ \Rightarrow \hat{H} &= \frac{-1}{2m} (\partial_x^2 + \partial_y^2) + \hat{V}(x, y) \end{aligned} \quad (7)$$

Now, imposing constraints on the state:

$$\begin{aligned} \hat{\phi}(\hat{x}, \hat{y}) \psi(x, y) &= 0 \\ \Rightarrow (\hat{x}^2 + \hat{y}^2 - r^2) \psi(x, y) &= 0 \end{aligned}$$

i.e., if the constraint is satisfied, the allowed states (or values) form a subset of the full space.

**We can use this formalism to quantize the system of a point particle.**

**Klein Gordon (KG) equation:**

Now, using equation (5), i.e.,

$$p^2 = m^2 \Rightarrow \text{constraint } \hat{\phi} = \hat{p}^2 - m^2 = 0$$

a.k.a. Schrödinger correspondence.

Imposing constraint on the state:

$$\begin{aligned} (\hat{p}^2 - m^2) \psi(x) &= 0 \\ \Rightarrow -(\partial^2 + m^2) \psi(x) &= 0 \end{aligned}$$

The KG (Klein-Gordon) equation!

### 3.2 Action for Massless Particle

From equation (1), we get:

$$S = m \int d\tau$$

(It wasn't first recognized as mass, but later leveled as mass from the constraint  $p^2 = m^2$ .)

Now, if  $m = 0$ ,  $S = 0$ ; action vanishes!

Then, the equivalent way to get around this problem is to define a new action:

$$S = \frac{1}{2} \int \left[ \frac{1}{e} \dot{x}^2 + em^2 \right] d\tau = \int \mathcal{L} d\tau \quad (8)$$

where  $e$  is a Lagrange multiplier and does not propagate to the equations of motion.

**Equation of motion for  $e$  :**

$$\begin{aligned} \frac{d}{d\tau} \frac{\partial \mathcal{L}}{\partial \dot{e}} - \frac{\partial \mathcal{L}}{\partial e} &= 0 \\ \Rightarrow -\frac{\partial}{\partial e} \left[ \frac{1}{e} \dot{x}^2 + em^2 \right] &= 0 \\ \Rightarrow -\left( -\frac{1}{e^2} \dot{x}^2 + m^2 \right) &= 0 \\ \therefore e &= \frac{\sqrt{\dot{x}^2}}{m} \end{aligned} \quad (9)$$

Putting in equation (8),

$$\begin{aligned} S &= \frac{1}{2} \int \left( \frac{m}{\sqrt{\dot{x}^2}} \dot{x}^2 + \frac{\sqrt{\dot{x}^2}}{m} m^2 \right) d\tau \\ &= \frac{1}{2} \int 2m\sqrt{\dot{x}^2} d\tau \\ &= m \int \sqrt{\dot{x}^2} d\tau \end{aligned} \quad (10)$$

and

$$p_a = \frac{\partial \mathcal{L}}{\partial \dot{e}} = \frac{\dot{x}}{e} \quad (11)$$

## Hamiltonian

$$\begin{aligned} H &= p_a \dot{x}^a - \mathcal{L} \\ &= \frac{\dot{x}}{e} \dot{x} - \frac{1}{2} \left( \frac{\dot{x}^2}{e} + em^2 \right) \\ &= \frac{\dot{x}^2}{e} - \frac{\dot{x}^2}{2e} - \frac{em^2}{2} \\ &= \frac{1}{2} e \left( \frac{\dot{x}^2}{e^2} - m^2 \right) \\ \therefore H &= \frac{1}{2} e \left( p_a^2 - m^2 \right) \end{aligned} \quad (12)$$

i.e., Hamiltonian is proportional to the constraint of the system:

$$H \propto (p_a^2 - m^2)$$

It means that the Hamiltonian vanishes “on-shell,” that is, when the constraints are satisfied. That is when real time evolution disappears.

**Extra:** Generic form of Schrödinger equation is:

$$i\hbar \frac{\partial \psi}{\partial t} = H\psi$$

- $H$  will change according to the system.
- In Cartesian coordinates, one particular form is

$$\left( -\frac{\hbar^2}{2m} \nabla^2 + V \right) \psi = H\psi = i\hbar \frac{\partial \psi}{\partial t}$$

- But in spin systems, the Hamiltonian will be

$$H = \mu \vec{B} \cdot \vec{S}$$

(Class-4) Lecture 1: Sat, May 17, 2025

**Poincaré Algebra**

Previously we've seen the Lagrangian for the massive and massless particles are -

$$\begin{aligned} L &= M\sqrt{\dot{x}_p \dot{x}^p} && \text{(massive)} \\ L &= \frac{1}{2}\left(\frac{1}{e}\dot{x}^2 - em^2\right) && \text{(massless)} \end{aligned}$$

These two are equivalent “on-shell” condition . **On-shell** means a particle or field satisfies its equation of motion - usually the relativistic energy momentum relation:  $E^2 = \vec{p}^2 + m^2$

So a particle is on shell if:  $p^\mu p_\mu = m^2$  This is called the **mass-shell condition**.

**Question: What is a particle?**

Particle is something that carries a unitary representation of the Poincaré group.

**Question: What is Lorentz transformation?**

A Lorentz transformation is a linear transformation that preserves the Minkowski spacetime interval-

$$\eta_{\mu\nu} x^\mu x^\nu = \eta_{\rho\sigma} x^\rho x^\sigma$$

That is,

$$x'^\mu = \Lambda^\mu{}_\nu x^\nu ; \quad \text{such that, } \Lambda^\top \eta \Lambda = \eta$$

Notes -

- The origin is invariant in the transformation.
- Rotation is also a linear transformation where origin is kept invariant

## 4.1 Poincaré transformation

Here the requirement that the origin remain invariant is relaxed, allowing transformations that preserve the interval between any two points including translation also.

Linear transformation which leaves the distance square between any two points invariant constitute Poincaré transformation. It is also a group.

**Question: What are groups?****(set + binary operation)**

A group is denoted by  $(G, *)$  is set of objects denoted  $G$  and some operation on those objects denoted  $*$ , subject to the following -

- Associative      • Inverse
- Close Set        • Existence of Identity

## 4.2 Poincaré/Affined group

Poincaré group = Lorentz group + Translation = Rotation + Boosts + Translation

$$x^m \rightarrow x'^m = (\Lambda x)^m + a^m = \Lambda^m{}_n x^n + a^m$$

Here,  $(\Lambda, a) \rightarrow$  set of elements  $\therefore x' = (\Lambda, a)x$

$\Lambda$  = Lorentz matrix

$a$  = Translation vector

### (i) Associativity

$$\begin{aligned} x' &= \Lambda x + a \\ \Rightarrow x &= \Lambda^{-1}(x' - a) \\ \Rightarrow x &= \Lambda^{-1}x' - \Lambda^{-1}a \\ \therefore (\Lambda, a)^{-1} &= (\Lambda^{-1}, -\Lambda^{-1}a) \end{aligned} \tag{4.1}$$

#### Note:

Is the space-time position operator ( $x^a$ ) a well-defined operator or observable in relativistic quantum theory?

**No, it is not.** Therefore, relativistic quantum mechanics in the usual sense does not exist — only *relativistic quantum field theory (QFT)* exists. This is because:

1. In non-relativistic quantum mechanics (NQRM), the position operator  $\hat{x}$  is well-defined. A particle can be localized in space and the wavefunction  $\psi(x, t)$  gives the probability amplitude for the particle's position.
2. In relativistic quantum mechanics (RQM), trying to promote space-time coordinates,  $x^a = (t, \vec{x})$ , to operators runs into problems due to:
  - Time and space do not enter symmetrically as operators — time is treated as a parameter, not as an operator.

Therefore, only **relativistic quantum fields** exist, where the fundamental objects are fields  $\hat{\phi}(x)$  — operator-valued functions over space-time.

**Observables are constructed from fields, not from position operators.**

### (ii) Identity

$$x' = x(\mathbb{I}, a)$$

#### 4.2.1 Group Composition

In Poincaré group, group composition refers to how two Poincaré transformations combine when applied one after the other. Now, the Lorentz transformation is,

$$x'^\mu = \Lambda^\mu{}_\nu x^\nu + a^\mu ; \quad \Lambda^\mu{}_\nu \in \text{SO}(1, 3)$$

Poincaré transformation is denoted as a pair,  $(\Lambda, a)$ . Meaning,

1. Apply Lorentz transformation,  $\Lambda$

2. Then translate by  $a$

Law: Given two transformations,

$$(\Lambda_1, a_1) = (\Lambda, a); (\Lambda_2, a_2) = (\Lambda', a')$$

Their composition [do  $(\Lambda', a')$  after  $(\Lambda, a)$ ] is,

$$\begin{aligned} (\Lambda', a')(\Lambda, a)x &= (\Lambda', a')(\Lambda x, a) \\ &= \Lambda'(\Lambda x + a) + a' \\ &= \Lambda'\Lambda x + \Lambda'a + a' \\ \therefore (\Lambda', a')(\Lambda, a) &= (\Lambda'\Lambda, \Lambda'a + a') \end{aligned} \quad (4.2)$$

Applying matrices R:

$$R(\Lambda', a')R(\Lambda, a) = R(\Lambda'\Lambda, \Lambda'a + a') \quad (4.3)$$

### Question: Why Unitary representation

Eugene Wigner classified all possible elementary particles in terms of irreducible unitary representations of the Poincaré group. These representations are labeled by:

- Particle's mass    • Particle's spin

We need unitary representations because of *the preservation of probability*. In quantum mechanics, we don't perform transformations on  $x$  directly, but on a wavefunction  $\psi(x)$ :

$$\psi'(x) = U(x)\psi(x) = \psi(x + a)$$

Then, if  $\langle \psi | \psi \rangle = \langle \psi' | \psi' \rangle$ , transformations are required to be unitary.

Therefore the unitary representation must satisfy (4.3) -

$$U(\Lambda', a')U(\Lambda, a) = U(\Lambda'\Lambda, \Lambda'a + a') \quad (4.4)$$

### Note: Dimension of Unitary Transformation in Hilbert Space

In Hilbert space, unitary transformations are not restricted to infinite dimensions. They can be finite or infinite dimensional depending on the physical system:

- Finite-dimensional unitary representations arise in systems with discrete bases — for example, spin systems where spin states form a finite-dimensional Hilbert space.
- Infinite-dimensional unitary representations are necessary for systems with continuous degrees of freedom — such as position and momentum representations in quantum mechanics.

Now,  $U^\dagger U = \hat{\mathbb{I}}$ ; If isomorphic and acts on Hilbert space.

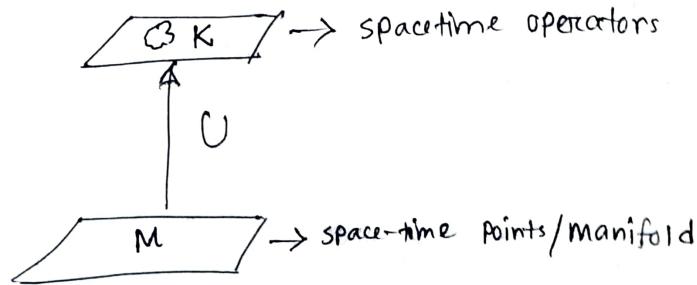

$$\text{If } gg' = g'' \text{ and } gg^{-1} = \mathbb{I}$$

$$\text{Then } U(g)U(g') = U(g'') \text{ and } U(g)U(g^{-1}) = U(\mathbb{I}) = \hat{\mathbb{I}}$$

$$\therefore U(g^{-1}) = U^\dagger(g)$$

$$\therefore U^\dagger(\Lambda, a) = U((\Lambda, a)^{-1}) = U(\Lambda^{-1}, -\Lambda^{-1}a) \quad (4.5)$$

This transformation acts on space time.

### Notes:

#### Group Representation

When studying symmetry transformations, we represent them using matrices that act on a vector space. The collection of such matrices that preserves the group structure is called a *representation* of the group. The space on which these matrices act is known as the *representation space*.

**Irreducible Representation:** A representation is called irreducible if it has no proper, non-trivial invariant subspace.

**Invariant Subspace:** Let  $T : V \rightarrow V$  be a linear operator on a vector space  $V$ . A subspace  $W \subseteq V$  is called \*invariant\* under  $T$  if:

$$\forall w \in W, \quad T(w) \in W$$

That is, applying  $T$  to any vector in  $W$  keeps it inside  $W$ .

#### Similarity Transformation

A similarity transformation rewrites a matrix  $A$  in a different basis using an invertible matrix  $S$ :

$$A' = SAS^{-1}$$

Key properties:

- (i)  $A$  and  $A'$  are similar matrices; they represent the same linear transformation in different bases.
- (ii) They have identical eigenvalues, trace, and determinant.

**Example:** If  $AB = C$ , then under similarity transformation:

$$A' = SAS^{-1}$$

$$B' = SBS^{-1}$$

$$\therefore A'B' = (SAS^{-1})(SBS^{-1}) = S(AB)S^{-1} = SCS^{-1} = C'$$

Thus,  $C'$  is the similarity transformation of  $C$ .

**Conjugation of a Group Element:**

If  $B' = SBS^{-1}$ , we call  $B'$  the *conjugate* of  $B$  by  $S$ . This does not imply a group product, it's a transformation under a change of basis.

Back to Wigner, recall (4.4) and (4.5) ,

$$U(\Lambda', a')U(\Lambda, a) = U(\Lambda'\Lambda, \Lambda'a + a') \quad (4.4)$$

$$U^\dagger(\Lambda, a) = U((\Lambda, a)^{-1}) = U(\Lambda^{-1}, -\Lambda^{-1}a) \quad (4.5)$$

Using both the equations we get,

$$\begin{aligned} U(\Lambda, a)U(\Lambda', a')U^\dagger(\Lambda, a) &= U(\Lambda\Lambda', \Lambda a' + a)U(\Lambda^{-1}, -\Lambda^{-1}a) \\ &= U(\Lambda\Lambda'\Lambda^{-1}, \Lambda\Lambda'(-\Lambda'a) + \Lambda a' + a) \\ &= U(\Lambda\Lambda'\Lambda^{-1}, \Lambda a' + (\mathbb{I} - \Lambda\Lambda'\Lambda^{-1})a) \end{aligned} \quad (4.6)$$

Then by combining (4.1) and (4.2) we get,

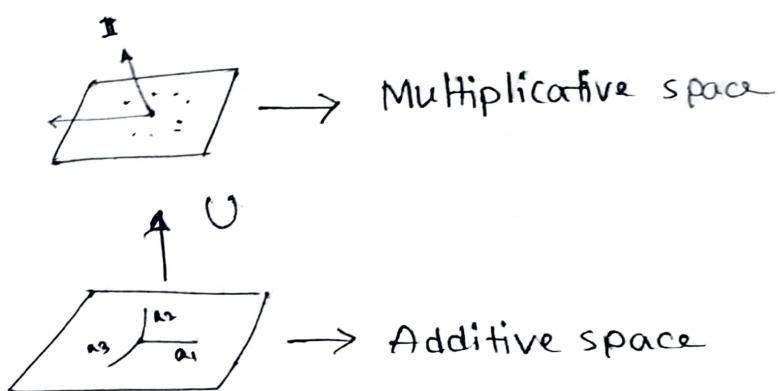

$$\begin{aligned} (\Lambda, a)(\Lambda', a')(\Lambda, a)^{-1} &\equiv (\Lambda\Lambda', \Lambda a' + a)(\Lambda', -\Lambda'a) \\ &= \Lambda\Lambda'\Lambda^{-1}, \Lambda\Lambda'(-\Lambda'a) + \Lambda a' + a \\ &= \Lambda\Lambda'\Lambda^{-1}, \Lambda a' + a - \Lambda\Lambda'\Lambda^{-1}a \\ &= (\Lambda\Lambda'\Lambda^{-1}, \Lambda a' + (\mathbb{I} - \Lambda\Lambda'\Lambda^{-1})a) \end{aligned} \quad (4.7)$$

Now, the theory of Lie groups tells us that we can write any unitary matrix in the form:

$$U(\theta) = e^{i\vec{\theta} \cdot \vec{H}} \quad , \quad \theta = (\theta_1, \theta_2, \dots), \quad H = (H_1, H_2, \dots)$$

where  $\vec{\theta}$  and  $\vec{H}$  are vectors of parameters and Hermitian operators, respectively. This form holds under the assumption:  $U(0) = \hat{\mathbb{I}}$

**Unitary transformation transforms the additive space to multiplicative space.**

### Note

It is also possible for  $U = -\hat{\mathbb{I}}$ , since

$$U^\dagger U = \mathbb{I}$$

However, this does **not** satisfy the condition  $U(0) = \hat{\mathbb{I}}$  and therefore cannot be expressed in the exponential form  $e^{i\vec{\theta} \cdot \vec{H}}$ .

Now for small  $\theta$ ,  $U(\theta)$  can be Taylor expanded-

$$U(\theta) = \hat{\mathbb{I}} + i \vec{\theta} \cdot \vec{H} + \dots$$

Now evaluation of the wave function can be written as the form-

$$\begin{aligned} \psi(x+a) &= e^{a \frac{d}{dx}} \psi(x) = \left(1 + a \frac{d}{dx} + \dots\right) \psi(x) \\ \Rightarrow \psi(x+a) &= e^{\frac{ia}{\hbar} (-i\hbar \frac{d}{dx})} \psi(x) \end{aligned}$$

Also for rotations we know that,

$$R^\top R = R^\top \mathbb{I} R = \mathbb{I}$$

and for Lorentz transformation,

$$\Lambda^\top \eta \Lambda = \eta$$

$$\begin{aligned} \text{Let, } R &= \mathbb{I} + \epsilon W \\ R^\top &= \mathbb{I} + \epsilon W^\top \end{aligned}$$

for small transformations where,  $\epsilon = \text{number}$ ,  $W = \text{matrix that generates the rotation}$ . It belongs to the Lie algebra of the rotation group  $\text{SO}(n)$ .

$$\begin{aligned} \therefore R^\top R &= (\mathbb{I} + \epsilon W^\top)(\mathbb{I} + \epsilon W) \\ &= \mathbb{I} + \epsilon(W^\top + W) + \epsilon^2 W^\top W \end{aligned}$$

Lie theory says that the substantial structure of group is encoded in its first order infinitesimals. So,  $\epsilon^2 \rightarrow 0$ . And  $R^\top R = \mathbb{I}$  implies that-

$$W = -W^\top \quad (\text{Antisymmetric})$$

In  $d$  dimensions,  $d \times d = d^n$  parameters, main diagonal constitute of 0. Therefore independent  $d^n - d$ , lower and upper triangular part have the same input except the sign. Hence number of the independent parameters are-

$$\frac{d^2 - d}{2} = \frac{d(d-1)}{2} = {}^d \mathbf{C}_2$$

Then the affine or, Poincaré group has

$$(\Lambda, a) \rightarrow \frac{d(d-1)}{2} + 1 = \frac{d(d+1)}{2} \quad \text{dimensions}$$

**This looks like rotation in  $(d + 1)$  dimensions!**

Now for Poincaré transformation,

$$x' = \Lambda x + a \quad ; \quad [\Lambda \rightarrow \text{Multiplicative (only for rotations)}, a \rightarrow \text{additive}]$$

Therefore, for the  $(d + 1)$  dimensional rotation it can be written as in  $2D$ :

$$\begin{pmatrix} x' \\ 1 \end{pmatrix} = \begin{pmatrix} \Lambda & a \\ 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ 1 \end{pmatrix} \quad ; \quad \left[ \begin{pmatrix} x \\ 1 \end{pmatrix} \rightarrow \begin{pmatrix} d \rightarrow \text{number of dimensions} \\ 1 \rightarrow 3^{rd} \text{ dimension: } z \text{ is fixed} \end{pmatrix} \right]$$

It implies the idea that “rotating in higher dimensions” can relate to translation in lower dimensions. **for example:** The rotation of laser points in  $2D$  plane. When projected, it results in an apparent translation along the  $z$  axis.

Now let Lorentz transformation be:

$$\Lambda' = \mathbb{I} + W' \quad (4.8)$$

$$\therefore U(\Lambda', a') = U(\mathbb{I} + W', a') = \hat{\mathbb{I}} + i a' \hat{P} + \frac{i}{2} W_{mn} \hat{J}^{mn} \quad (4.9)$$

here,  $\frac{1}{2}$  → factor here is to avoid double counting

as  $W_{mn}$  is antisymmetric matrix

$\hat{P}$  → an operator whether it is translational

or not will be given by its “Algebra”

$$W_{mn} = -W_{nm} \quad ; \quad \hat{J}^{mn} = -\hat{J}^{nm} \quad ; \quad a' = \text{a number}$$

Let's get back to Wigner once more. Using equation (4.8) in  $\Lambda \Lambda' \Lambda^{-1}$  we get,

$$\Lambda \Lambda' \Lambda^{-1} = \Lambda (\mathbb{I} + W') \Lambda^{-1} = \mathbb{I} + \Lambda W' \Lambda^{-1} \quad (4.10)$$

$$\text{and, } \Lambda a' + (\mathbb{I} - \Lambda \Lambda' \Lambda^{-1}) a = \Lambda a' - \Lambda W' \Lambda^{-1} a \quad (4.11)$$

Recall equation (4.6):

$$U(\Lambda, a) U(\Lambda', a') U^\dagger(\Lambda, a) = U(\Lambda \Lambda' \Lambda^{-1}, \Lambda a' + (\mathbb{I} - \Lambda \Lambda' \Lambda^{-1}) a) \quad (4.6)$$

Now combining equation (4.6), (4.9), (4.10), (4.11) we will get:

$$\begin{aligned} \therefore U(\Lambda, a) U(\Lambda', a') U^\dagger(\Lambda, a) &= U(\Lambda, a) \left[ \hat{\mathbb{I}} + i a' \hat{P} + \frac{i}{2} W_{mn} \hat{J}^{mn} \right] U^\dagger(\Lambda, a) \\ \Rightarrow U(\Lambda \Lambda' \Lambda^{-1}, \Lambda a' + (\mathbb{I} - \Lambda \Lambda' \Lambda^{-1}) a) &= U(\Lambda, a) \left[ \mathbb{I} + i a'_n \hat{P}^n + \frac{1}{2} W_{mn} \hat{J}^{mn} \right] U^\dagger(\Lambda, a) \\ \Rightarrow U(\mathbb{I} + \Lambda W \Lambda^{-1}, \Lambda a - \Lambda W \Lambda^{-1} a) &= U(\Lambda, a) \left[ \mathbb{I} + i a'_n \hat{P}^n + \frac{1}{2} W_{mn} \hat{J}^{mn} \right] U^\dagger(\Lambda, a) \\ \Rightarrow \mathbb{I} + i a'_n U(\Lambda, a) \hat{P}^n U^\dagger(\Lambda, a) + \frac{i}{2} W_{mn} U(\Lambda, a) \hat{J}^{mn} U^\dagger(\Lambda, a) & \\ = \mathbb{I} + i(\Lambda a' - \Lambda W \Lambda^{-1})_n \hat{P}^n + \frac{i}{2} (\Lambda W \Lambda^{-1})_{pq} \hat{J}^{pq} & \quad (4.12) \end{aligned}$$

$$\begin{aligned} \Rightarrow i a'_n U(\Lambda, a) \hat{P}^n U^\dagger(\Lambda, a) + \frac{i}{2} W_{mn} U(\Lambda, a) \hat{J}^{mn} U^\dagger(\Lambda, a) & \\ = i(\Lambda a')_n \hat{P}^n + \frac{i}{2} (\Lambda W \Lambda^{-1})_{pq} \hat{J}^{pq} - i(\Lambda W \Lambda^{-1})_n \hat{p}^n & \quad (4.13) \end{aligned}$$

Now matching the coefficients of  $a'$  on both side of the equation (4.13),

$$i a'_n U(\Lambda, a) \hat{P}^n U^\dagger(\Lambda, a) = i(\Lambda a')_m \hat{P}^m = i \Lambda_m{}^s a'_s \hat{P}^m = i \Lambda_m{}^n a'_n \hat{P}^m$$

$$\therefore U(\Lambda, a) \hat{P}^n U^\dagger(\Lambda, a) = \Lambda_m{}^n \hat{P}^m$$

Thus we can see that,  $\hat{P}$  transforms like a vector under the group. It is a constant matrix. It doesn't depend on the coordinates or the values of  $a'$ .

### Assignment-1:

How does  $\hat{J}^{rs}$  transform under Poincaré transformation? (It's a semi direct product)

**Note:**

#### Direct Product and Semi-direct product

In group theory, a direct product of two groups means that the groups combine in a way where elements of one group do not affect the operation of the other. That is:

$$(a_1, b_1)(a_2, b_2) = (a_1 a_2, b_1 b_2)$$

Here, two group elements become separated completely.

Poincaré group combines Lorentz transformations and spacetime translations as:

$$(\Lambda', a')(\Lambda, a) = (\Lambda' \Lambda, \Lambda' a + a')$$

Here, the second translation is transformed by  $\Lambda'$ , meaning the two parts interact nontrivially. Hence, this is not a direct product but a **semi-direct product**. The Lorentz part  $\Lambda'$  transforms the translation  $a$ , indicating that the two subgroups are not independent.

### Transformation of $\hat{J}^{pq}$ under Lorentz transformation

Assume  $a = 0 \equiv$  No translation under Lorentz transformation. From the equation (4.12),

$$\begin{aligned} & \mathbb{I} + ia'_n U(\Lambda, a) \hat{P}^n U^\dagger(\Lambda, a) + \frac{i}{2} W'_{mn} U(\Lambda, a) \hat{J}^{mn} U^\dagger(\Lambda, a) \\ &= \mathbb{I} + i(\Lambda a' - \Lambda W' \Lambda^{-1})_n \hat{P}^n + \frac{i}{2} (\Lambda W' \Lambda^{-1})_{pq} \hat{J}^{pq} \end{aligned}$$

Putting  $a = 0$  and comparing the  $2^{nd}$  term on both sides,

$$\begin{aligned} & W'_{pq} U \hat{J}^{pq} U^\dagger = (\Lambda W' \Lambda^{-1})_{ab} \hat{J}^{ab} \\ & \Rightarrow W'_{pq} U \hat{J}^{pq} U^\dagger = \Lambda_a{}^m W'_{mn} (\Lambda^{-1})_b{}^n \hat{J}^{ab} \\ & \quad \text{By setting } m = p, n = q ; \text{ we get,} \\ & \Rightarrow W'_{pq} U \hat{J}^{pq} U^\dagger = \Lambda_a{}^p W'_{pq} (\Lambda^{-1})_b{}^q \hat{J}^{ab} \\ & \Rightarrow U \hat{J}^{pq} U^\dagger = \Lambda_a{}^p (\Lambda^{-1})_b{}^q \hat{J}^{ab} \end{aligned} \tag{4.14}$$

Now, recall the Lorentz transformation,

$$\begin{aligned} & \Lambda^\top \eta \Lambda = \eta \\ & \Rightarrow \Lambda^\top \eta = \eta \Lambda^{-1} \\ & \therefore \eta \Lambda^\top \eta = \Lambda^{-1} \end{aligned} \tag{4.15}$$

Putting this value of  $\Lambda^{-1}$  in equation (4.14) we get,

$$\begin{aligned} U \hat{J}^{pq} U^\dagger &= \Lambda_a{}^p (\eta \Lambda^\top \eta)^q{}_b \hat{J}^{ab} \\ &= \Lambda_a{}^p \eta^q{}_r \Lambda^r{}_s \eta^s{}_b \hat{J}^{ab} \\ &= \Lambda_a{}^p \Lambda^q{}_s \hat{J}^{as} \\ &= \Lambda_a{}^p \Lambda^q{}_b \hat{J}^{ab} \end{aligned}$$

$$\boxed{\therefore U \hat{J}^{pq} U^\dagger = \Lambda_a{}^p \Lambda^q{}_b \hat{J}^{ab}}$$

Now substituting,  $U = e^{(\frac{i}{2}W_{cd} \hat{J}^{cd})}$  and  $\Lambda^p{}_a = \delta^p{}_a + W^p{}_a$  Then,

$$\begin{aligned} e^{(\frac{i}{2}W_{cd} \hat{J}^{cd})} \cdot e^{(-\frac{i}{2}W_{cd} \hat{J}^{cd})} &= (\delta_a{}^p + W^p{}_a)(\delta^q{}_b + W^p{}_b) \hat{J}^{ab} \quad [\text{BCH Relation}] \\ \Rightarrow \hat{J}^{pq} + \frac{i}{2}W_{cd}[\hat{J}^{cd}, \hat{J}^{pq}] &= (\delta_a{}^p \delta^q{}_b + \delta_a{}^p W^p{}_b + W^p{}_a \delta^q{}_b + W^p{}_a W^p{}_b) \hat{J}^{ab} \\ \Rightarrow \hat{J}^{pq} + \frac{i}{2}W_{cd}[\hat{J}^{cd}, \hat{J}^{pq}] &= \hat{J}^{pq} + W^q{}_b \hat{J}^{pb} + W^p{}_a \hat{J}^{aq} \\ \Rightarrow \frac{i}{2}W_{cd}[\hat{J}^{cd}, \hat{J}^{pq}] &= W_{mb} \eta^{mq} \hat{J}^{pb} + W_{na} \eta^{np} \hat{J}^{aq} \\ \Rightarrow \frac{i}{2}W_{cd}[\hat{J}^{cd}, \hat{J}^{pq}] &= W_{cd} \eta^{cq} \hat{J}^{pd} + W_{cd} \eta^{cp} \hat{J}^{dq} \quad [b = d, m = c, a = d, n = c] \\ \Rightarrow \frac{i}{2}W_{cd}[\hat{J}^{cd}, \hat{J}^{pq}] &= W_{cd} \times \frac{1}{2} (\eta^{cq} \hat{J}^{pd} - \eta^{dq} \hat{J}^{pc}) + W_{cd} \times \frac{1}{2} (\eta^{cp} \hat{J}^{dq} - \eta^{dp} \hat{J}^{cq}) \\ \left[ \text{Here we used, } AB = \frac{1}{2}(AB + BA) + \frac{1}{2}(AB - BA) \right] \end{aligned}$$

Omitting  $W_{cd}$  on both sides,

$$\begin{aligned} \Rightarrow [\hat{J}^{cd}, \hat{J}^{pq}] &= -i (\eta^{cq} \hat{J}^{pd} - \eta^{dq} \hat{J}^{pc} + \eta^{cp} \hat{J}^{dq} - \eta^{dp} \hat{J}^{cq}) \\ \therefore [\hat{J}^{cd}, \hat{J}^{pq}] &= -i (\eta^{cq} \hat{J}^{pd} - \eta^{dq} \hat{J}^{pc} + \eta^{pc} \hat{J}^{dq} - \eta^{pd} \hat{J}^{cq}) \end{aligned}$$

### Summary

Here we have successfully found the algebra of angular momentum without the relation  $\hat{J} = \vec{r} \times \vec{p}$ , just simply using the algebra of the Poincaré group.

In addition, we know in 3D,  $\hat{J}^m = i \epsilon^{amn} \hat{J}_a$

**Assignment-2:** Recover 3D rotation algebra from angular momentum.

(Class-5) Lecture 2: Sat, May 24, 2025

## A Glimpse of GR via The Classical Field Theory

### 5.1 Road to GR

[General relativity is a classical field theory because no quantization is involved here]  
Now, in freely falling coordinates (FFC), the line element is given by:

$$ds^2 = \eta_{ab} d\xi^a d\xi^b \quad (5.1)$$

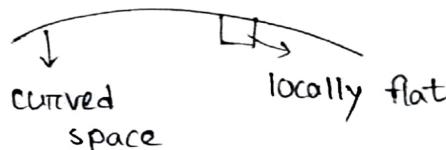

Notation:  $\eta_{ab}$  : Flat Minkowski metric

$\xi^a$  : Freely falling coordinates (FFC)

$x^a$  : General coordinates

#### Note:

- In Special Relativity (SR), there is no representation of gravity.
- Only in curved space there is an existence of gravity hence acceleration arises.

However, the FFC are locally defined as:

$$\begin{aligned} \xi^a &= \xi^a(x) \\ \Rightarrow d\xi^a &= \frac{\partial \xi^a}{\partial x^m} dx^m \\ \Rightarrow d\xi^a &\equiv M^a_m dx^m \quad (\text{linear relation}) \end{aligned} \quad (5.2)$$

Substituting (5.2) into (5.1), we get:

$$ds^2 = \eta_{ab} \frac{\partial \xi^a}{\partial x^m} \frac{\partial \xi^b}{\partial x^n} dx^m dx^n \quad (5.3)$$

here,  $\left[ \eta_{ab} \frac{\partial \xi^a}{\partial x^m} \frac{\partial \xi^b}{\partial x^n} \right] = \text{symmetric, depends on } x$

Let us define this term as:

$$G_{mn}(x) \equiv \eta_{ab} \frac{\partial \xi^a}{\partial x^m} \frac{\partial \xi^b}{\partial x^n}$$

Then:

$$ds^2 = G_{mn}(x) dx^m dx^n$$

$G_{mn}(x)$  is called the metric which describes distance in a curved spacetime and has the following properties:

1. **Symmetry:**  $G_{mn} = G_{nm}$

2. **Non-degeneracy:** If  $\det(G_{mn}) \neq 0$ , then  $G_{mn}$  is invertible.

Such a manifold is known as a *Riemannian manifold* (or pseudo-Riemannian in Lorentzian spacetime).

**Action:** Recall the relativistic action:

$$s = m \int \sqrt{\eta_{ab} \dot{\xi}^a \dot{\xi}^b} d\tau \quad (\text{non-polynomial Lagrangian})$$

$$s' = \frac{1}{2} \int \left( \frac{1}{e} \dot{\xi}^a \dot{\xi}^b \eta_{ab} - em^2 \right) d\tau$$

- First term in  $s'$ : kinetic term.
- Second term in  $s'$ : Lagrange multiplier (enforces mass-shell condition).

When  $m = 0$ , both  $s$  and  $s'$  are same, they yield the same dynamics.

### Note:

For flat spacetime in Cartesian coordinates, the trajectory of a free particle is:

$$x^i = x_0^i + \left( \frac{p^i}{m} \right) t$$

This equation -

- is valid only in Cartesian coordinates and flat spacetime.
- has all quantities here carry upper indices (contravariant).

### Conjugate Momenta:

$$p_i = \frac{\partial \mathcal{L}}{\partial \dot{q}^i}$$

- $p_i$  and  $q^i$  have different index positions because they live in dual spaces.
- The momentum  $p_i$  lives in the **cotangent space** (dual vector space) to the configuration space.

Consider, for example, a scalar function:

$$\phi(x) = \phi'(\xi)$$

where  $x$  could be any coordinate system (e.g., spherical, Cartesian, etc.). Then,

$$\frac{\partial \phi'(\xi)}{\partial \xi^a} = \frac{\partial \phi(x)}{\partial x^m} \cdot \frac{\partial x^m}{\partial \xi^a} \quad (5.4)$$

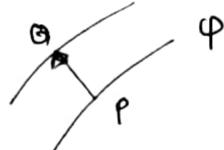

Recall equation (5.3):

$$ds^2 = \eta_{ab} \frac{\partial \xi^a(x)}{\partial x^m} \frac{\partial \xi^b(x)}{\partial x^n} dx^m dx^n = G_{mn}(x) dx^m dx^n$$

These equations (5.3) and (5.4) are inverse to each other — they reflect the transformation between coordinates and dual coordinates.

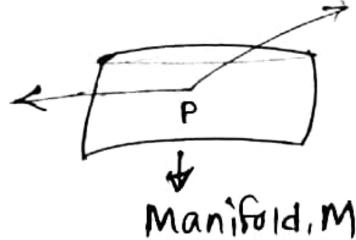

**Note:****Phase Space**

- The cotangent space of a manifold is called the **phase space**.
- The collection of all  $x$  and  $p$  coordinates also forms the phase space.
- The collection of all initial conditions again constitutes a phase space.

**Differential and Gradient**

$$d\phi = dx \cdot \nabla \phi$$

- The gradient  $\nabla \phi$  lives in the dual space.
- If  $v \rightarrow \mathbb{R}$ , and  $\langle w, v \rangle \in \mathbb{R}$  then  $w$  and  $v$  are not in the same space.
- $w$  is the dual vector space of  $v$ .

**Tangent Bundle**

A **tangent bundle** is the collection of all tangent spaces for all points on a manifold:

- Let  $T_p(M)$  be the tangent space at point  $p$  on manifold  $M$ .
- Then,  $\bigcup_p T_p(M) \equiv T(M)$  is the tangent bundle of  $M$ .

**Summary:** The differential and the gradient are **dual** to each other.

**5.2 Particle trajectory in a curved spacetime**

From the action:

$$S[x] = \frac{1}{2} \int d\tau \xi^a \dot{\xi}^b \eta_{ab} = \frac{1}{2} \int d\tau G_{mn}(x) \dot{x}^m \dot{x}^n ; \quad [\dot{x}^m \dot{x}^n = \text{squared 4-velocity term}]$$

Now, from the action principle (i.e.,  $\delta S = 0$ ), we can derive the equation of motion of the particle.

$$\delta S = \frac{1}{2} \int \left[ \delta G_{mn}(x) \frac{dx^m}{d\tau} \frac{dx^n}{d\tau} + 2G_{mn}(x) \frac{d}{d\tau}(\delta x^m) \frac{dx^n}{d\tau} \right] d\tau$$

Here Second term is symmetric in  $m, n$ , thus the term doubles. Then applying integration by parts  $\left[ u = \frac{d}{d\tau}(\delta x^m) , v = G_{mn}(x)\dot{x}^n = G_{mn}(x) \frac{dx^n}{d\tau} \right]$ ,

$$\begin{aligned}\delta S &= \frac{1}{2} \int \left[ \left\{ \frac{\partial G_{mn}}{\partial x^p} \dot{x}^m \dot{x}^n \delta x^p \right\} + 2 G_{mn} \frac{dx^n}{d\tau} \delta x^m \right] - 2 \frac{d}{d\tau} \left( G_{mn} \frac{dx^n}{d\tau} \right) \delta x^m d\tau \\ &= \frac{1}{2} \int \left[ \frac{\partial G_{mn}}{\partial x^p} \dot{x}^m \dot{x}^n \delta x^p - 2 \left( G_{mn} \ddot{x}^n + \frac{\partial G_{mn}}{\partial x^p} \dot{x}^p \dot{x}^n \right) \delta x^m \right] d\tau \\ &= \int \left[ \frac{1}{2} \partial_p G_{mn} \dot{x}^m \dot{x}^n \delta x^p - G_{mn} \ddot{x}^n \delta x^m - \partial_p G_{mn} \dot{x}^p \dot{x}^n \delta x^m \right] d\tau \\ &= - \int \left[ G_{mn} \ddot{x}^n + \left( \partial_p G_{mn} \dot{x}^p \dot{x}^n - \frac{1}{2} \partial_m G_{np} \dot{x}^n \dot{x}^p \right) \right] \delta x^m d\tau \\ &= - \int \left[ G_{mn} \ddot{x}^n + \frac{1}{2} (\partial_p G_{mn} + \partial_n G_{mp} - \partial_m G_{np}) \dot{x}^n \dot{x}^p \right] \delta x^m d\tau\end{aligned}$$

Here, in the first line, the term  $2 G_{mn} \frac{dx^n}{d\tau} \delta x^m \Big| = 0$  at the boundary.  $\delta x^\mu$  is arbitrary, therefore to satisfy the action principle, the integrand must vanish which gives:

$$\begin{aligned}G_{mn} \ddot{x}^n + \frac{1}{2} (\partial_p G_{mn} + \partial_n G_{mp} - \partial_m G_{np}) \dot{x}^n \dot{x}^p &= 0 \\ \Rightarrow \ddot{x}^n + \frac{1}{2} G^{nm} (\partial_p G_{mn} + \partial_n G_{mp} - \partial_m G_{np}) \dot{x}^n \dot{x}^p &= 0\end{aligned}$$

In the second term,

$$\frac{1}{2} G^{nm} (\partial_p G_{mn} + \partial_n G_{mp} - \partial_m G_{np}) = \Gamma^m_{np} \rightarrow \text{Christoffel Symbol}$$

$$\therefore \ddot{x}^n + \Gamma^m_{np} \dot{x}^n \dot{x}^p = 0$$

This is the **geodesic equation**.

Therefore, the acceleration is proportional to the square of velocity,  $\dot{x}^2$ .

But in *electromagnetism*:

$$\ddot{x}^m = F^m{}_n \dot{x}^n \quad (\text{Lorentz force equation})$$

So here, acceleration is proportional to a 4-vector.

### Exercise

$$S = \frac{1}{2} \int m \dot{\xi}^2 d\tau + q \int A_b(\xi) \dot{\xi}^b d\tau$$

[ This latter interaction term is geometrical as well ]

- Show that we can recover the Lorentz force from here.

### 5.3 Schur's Lemma

Schur's Lemma involves two such equations. Before understanding the lemma, we need to understand some definitions first.

## Representation

Let:

$$AB = C \Rightarrow R(A)R(B) = R(C)$$

Here,  $R$  is a matrix-valued map that forms an algebra. This is called a **representation**.

## Invariant Subspaces

It begins with the question: are there subspaces on which the representation maps onto itself? The answer is **null-space**  $R(0) \rightarrow 0$ .

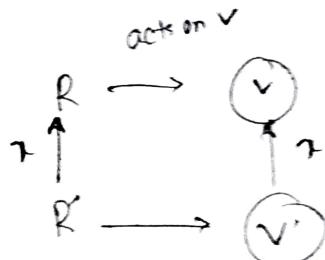

- In the case of rotation, the invariant subspace is the **axis** of rotation.
- Except for the entire space and the trivial zero vector, any other invariant subspace (if exists) implies the representation is **reducible**.

## Irreducible Representations (Irreps)

If no invariant subspace exists, it is called an **irreducible representation**. For irreducible representations:

- No non-trivial invariant subspaces exist.
- Any operator commuting with all elements of the representation is proportional to the identity.

## Statement of Schur's Lemma

Let  $V$  and  $V'$  be vector spaces, and let  $R$  and  $R'$  be two representations of a group  $G$ . That is, to each group element  $g \in G$ , we assign a matrix (or linear transformation)  $R(g)$  acting on  $V$ , and  $R'(g)$  acting on  $V'$ , such that:

$$R(g_1 g_2) = R(g_1)R(g_2), \quad R'(g_1 g_2) = R'(g_1)R'(g_2) \quad \forall g_1, g_2 \in G$$

Suppose there exists a linear map (or matrix)  $X : V \rightarrow V'$  such that for all  $g \in G$ ,

$$XR(g) = R'(g)X$$

### Intertwiner

Let  $R, R'$  be two irreps and

$$RX = XR'$$

To make this possible, there exists two possibilities for  $X$ .

1.  $X$  is invertible.
2. Then:

$$X^{-1}RX = R'$$

That is,  $X$  *intertwines* the two representations—it commutes with the group action. If  $X$  commutes with all the matrices of an irrep, then  $X = \lambda\mathbb{I}$ , i.e., it's proportional to the identity matrix. Example:

$$[J_1, J_2] = iJ_3 \quad ; \quad [J^2, J_i] = 0 \quad \therefore J^2 \propto \mathbb{I}$$

That is, any linear transformation that commutes with all the representation matrices must be a scalar multiple of the identity.

Note: Commutator is a derivative

Anything that follows the product rule, is called a **derivation**.

$$\frac{d}{dx}(uv) = \frac{du}{dx}v + u\frac{dv}{dx}$$

$$[A, uv] = [A, u]v + u[A, v]$$

Therefore, **Commutation** is a **derivation**

**Exercises:** Check the commutations:

$$\begin{aligned}[J, p] &\sim p \\ [p, p] &\sim 0 \\ [J, J] &\sim J \\ [J, p^2] &\sim 0 \\ [J, p_a p^a] &= [J, p_a]p^a + p_a[J, p^a] \sim 0\end{aligned}$$

Notes regarding the exercises:

- We can do QFT just because of  $p^2$ .
- No quantum version of Lorentz group exists.
- If  $[A, \mathcal{V}] = 0$ , then  $\mathcal{V}$  can only be constant.

(Class-6) Lecture 3: Sat, May 31, 2025

**Lie Derivative****Some Clarifications from Previous Lecture**

- The Lorentz group doesn't have any invariant subalgebra.

**Invariant Subgroup:** A subgroup  $N \subset G$  is **invariant** if -

$$g n g^{-1} \in N \quad \forall g \in G$$

That means, conjugating any element of  $N$  by any element of  $G$  keeps it inside  $N$ . Therefore, for any group element  $g$ , if

$$\begin{aligned} gg^{-1} &= g'' \quad (\text{conjugating each like similarity transformation}) \\ \Rightarrow hgh^{-1} \cdot hgh^{-1} &= h g'' h^{-1} \quad (\text{where } hgh^{-1} = g, h \in G) \\ \Rightarrow g g^{-1} &= g g^{-1} \quad \therefore h e h^{-1} = e \rightarrow \text{unaffected} \end{aligned}$$

**Invariant**

Under conjugation, things get mapped, but some things remain unchanged — that is called **invariant**.

**Automorphism**

An **automorphism** is a structure-preserving map from a mathematical object to itself.

**Invariant Subalgebra**

A subalgebra  $h \subset g$  is said to be **invariant** if:

$$[X, H] \in h \quad \forall X \in g, H \in h$$

That is, the Lie bracket of any element of the full algebra with any element of the subalgebra lies inside the subalgebra.

Therefore, if  $h = e^A$  where  $A \in$  Lie algebra and  $h \in$  Lie group, then:

$$\begin{aligned} hg h^{-1} &= g' \\ \Rightarrow e^A e^B e^{-A} &\sim e^{B+[A,B]} = e^{B'} \quad (\because [A, B] \sim B') \end{aligned}$$

( $g$  doesn't have to be  $g'$ , it just has to map into the subalgebra.)

Because boosts and rotations are mixed under commutators, they don't form invariant pieces.

## Notes

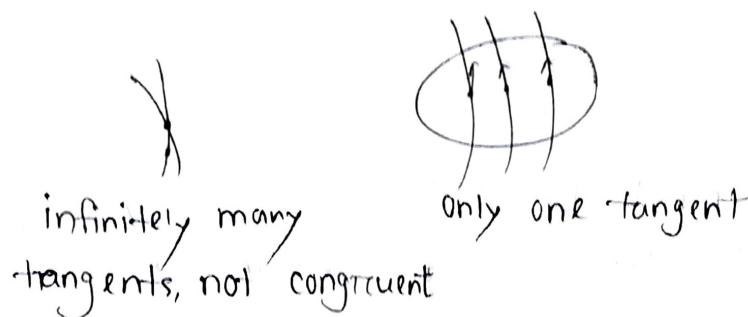

- The Lorentz group also has no unitary representation because it is **non-compact**.
- The Poincare group has unitary representation because is **compact**.
- Every finite group has a unitary representation.
- **Peter-Weyl theorem** states that “compact groups have the same structure as finite groups.”
- Hence, compact groups too have a unitary representation.
- On the other hand, boost transformations form an infinite set of elements.
- Boosts are parameterized by the *rapidity* (or velocity), which is a continuous real parameter.
- Boosts are generated by the non-compact part of the Lorentz algebra  $SO(1, 3)$ .
- Since the group is continuous and non-compact, it has infinitely many elements—like translations or rotations. Hence, **no unitary representation**.

## 6.1 Lie Derivative

### 6.1.1 Congruence

A congruence is a family of smooth curves such that through every point in a region (or patch) of spacetime, exactly one curve passes.

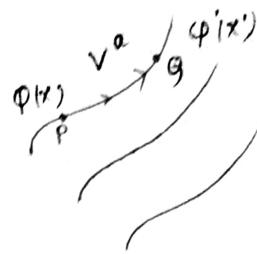

- Congruence implies a well-defined vector field and vice-versa.
- *Diffeomorphism*: A map from spacetime into itself in a continuous manner, again in the same space.

### Defining Lie Derivative

We have learned about congruence because –“The Lie derivative measures how a tensor field changes along a flow, and a congruence provides exactly that flow.”

- Lie derivative only needs congruence/vector field.
- Covariant derivative needs dot product (metric structure).

Let point  $P$  be mapped into  $Q$  due to congruence. Let the coordinate transformation be:

$$x^a \rightarrow x'^a = x^a + t v^a,$$

- It is a flow where  $t$  is a flow parameter (an infinitesimal step)
- $v^a$  is the vector field generating the flow.

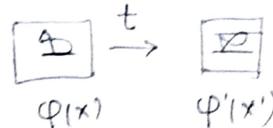

Therefore, the Lie derivative of a scalar field  $\phi$  is defined as:

$$\mathcal{L}_v \phi = \lim_{t \rightarrow 0} \frac{\phi_{-t}(x') - \phi(x)}{t}$$

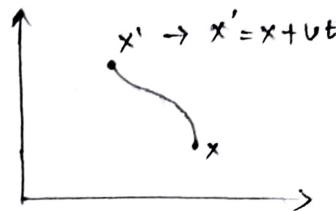

This describes the evolution of the field along the flow lines defined by the congruence.

Note: Why  $\phi_{-t}(x')$  ?

The evolution of the system itself. Negative time means back to its own position.

## 6.2 Lie Derivative for a Scalar Field

Here, only coordinates change, the field doesn't change. Therefore, for a scalar field, it is simply,  $\phi'(x') = \phi(x)$ , no involvement of direction. We want to calculate the field at the initial position, i.e.,

$$\begin{aligned} \phi'(x) &= \phi'(x' - vt) \\ &= \phi'(x') - t v^a \partial'_a \phi'(x') + \dots \quad [\text{Expanding in Taylor series}] \\ &= \phi(x) - t v^a \partial'_a \phi(x) \quad [\text{Only keeping the first-order term in } t] \end{aligned}$$

Therefore, the Lie derivative:

$$\begin{aligned}\mathfrak{L}_v \phi &= \lim_{t \rightarrow 0} \frac{\phi'(x) - \phi(x)}{t} \\ &= \lim_{t \rightarrow 0} \frac{-t v^a \partial_a \phi(x)}{t} \\ &= -v^a \partial_a \phi(x) \\ &= -(\vec{v} \cdot \nabla) \phi(x) \\ &= -\hat{v} \phi(x)\end{aligned}$$

This is nothing but the directional derivative in 3D.

Hence, the Lie derivative of a scalar field is just the directional derivative of  $\phi$  along the vector  $v^a$ . And it's a linear combination of partial derivatives weighted by the components of the vector field  $v^a$ .

### 6.3 Lie Derivative of a Vector Field

Similarly,  $V(x)$  is a vector field defining the flow, and  $W(x)$  is another vector field (the one we want to differentiate). Now, the lie derivative:

$$\mathfrak{L}_{\hat{V}} W^a = \lim_{t \rightarrow 0} \frac{W'^b(x) - W^a(x)}{t}$$

(where  $W'^b$  is the new vector field at position  $Q$ , while  $W^a$  is at position  $P$ )

This change tells us how the vector field  $W$  changes when dragged along the flow generated by  $V$ . Therefore,

$$\begin{aligned}x &\rightarrow x' + Vt \\ W^a(x) &\rightarrow W'^b(x') = \frac{\partial x'^a}{\partial x^m} W^m(x) \\ &\Rightarrow W'^b(x') = \frac{\partial}{\partial x^m} (x^a + V^a t) W^m(x) \\ &\Rightarrow W'^b(x + Vt) = (\delta_m^a + t \partial_m V^a) W^m(x) \\ &\Rightarrow W'^b(x) + t V^b \partial'_b W^b(x) = \delta_m^a W^m(x) + t W^m(x) \partial_m V^a \\ &\Rightarrow W'^b(x) - W^a(x) = t (W^m \partial_m V^a - V^b \partial'_b W^b) \\ &\Rightarrow \frac{W'^b(x) - W^a(x)}{t} = W^m \partial_m V^a - V^b \partial'_b W^b \\ \boxed{\therefore \mathfrak{L}_{\hat{V}} W^a = W^m \partial_m V^a - V^b \partial'_b W^b = W^m \partial_m V^a - V^b \partial_b W^a}\end{aligned}$$

This is the lie derivative of a vector field. Let's simply it,

$$\begin{aligned}
 (\mathcal{L}_{\hat{V}} W^a)(\phi) &= (W^m \partial_m V^a - V^b \partial_b W^a)\phi = (W^b \partial_b V^a - V^b \partial_b W^a)\phi \quad [m = b] \\
 &= (W^b \partial_b V^c - V^b \partial_b W^c)\partial_c \phi \\
 &= (W^b \partial_b V^c \partial_c \phi + W^b V^c \partial_b \partial_c \phi) - (V^b \partial_b W^c \partial_c \phi + W^b V^c \partial_b \partial_c \phi) \\
 &= W^b \partial_b (V^c \partial_c \phi) - V^b \partial_b (W^c \partial_c \phi) \\
 &= (\hat{W} \hat{V} - \hat{V} \hat{W}) \phi(x) \\
 &= [\hat{W}, \hat{V}] \phi(x) = -[\hat{V}, \hat{W}] \phi(x)
 \end{aligned}$$

$$\therefore \mathcal{L}_{\hat{V}} W^a = -[\hat{V}, \hat{W}]^a$$

Hence, two vector fields are mapped to another vector field.  $[\hat{V}, \hat{W}]$  creates a vector field out of the two vector fields  $\hat{V}$  and  $\hat{W}$ .

Note:

Recall the Jacobi identity:

$$[ [A, B], C ] + [ [B, C], A ] + [ [C, A], B ] = 0$$

**The Jacobi identity is true for all algebra.**

**Exercise:** Show that-

$$\mathcal{L}_{\hat{V}} \mathcal{L}_{\hat{W}} - \mathcal{L}_{\hat{W}} \mathcal{L}_{\hat{V}} = \mathcal{L}_{[\hat{V}, \hat{W}]}$$

SO far we've seen that a Lie derivative maps -

- Scalar to scalar
- Vector to vector
- Tensor to tensor. All of the same type.

Covector

A **covector** is a type of linear map that acts on vectors and returns real or complex numbers.

- A vector is an element of the space  $V$
- A covector is an element of the dual space  $V^*$

$$(\text{Vector})^b \cdot (\text{Covector})_b = \text{Scalar}$$

## 6.4 Lie Derivative of a Covector

$$\begin{aligned}
\mathfrak{L}_{\hat{V}}(W^a U_a) &= - V^c \partial_c (W^a U_a) \\
\Rightarrow (\mathfrak{L}_{\hat{V}} W^a) U_a + W^a (\mathfrak{L}_{\hat{V}} U_a) &= -\{ V^c (\partial_c W^a) U_a + V^c W^a (\partial_c U_a) \} \\
\Rightarrow (W^c \partial_c V^a - V^c \partial_c W^a) U_a + W^a (\mathfrak{L}_{\hat{V}} U_a) &= - V^c (\partial_c W^a) U_a - V^c W^a (\partial_c U_a) \\
\Rightarrow W^c \partial_c V^a U_a + W^a (\mathfrak{L}_{\hat{V}} U_a) &= -V^c W^a \partial_c U_a \\
\Rightarrow W^a (\mathfrak{L}_{\hat{V}} U_a) &= -(W^c \partial_c V^a U_a + V^c W^a \partial_c U_a) \\
\Rightarrow W^a (\mathfrak{L}_{\hat{V}} U_a) &= -(W^a \partial_a V^c U_c + V^c W^a \partial_c U_a) = - W^a (\partial_a V^c U_c + V^c \partial_c U_a)
\end{aligned}$$

$\therefore \mathfrak{L}_{\hat{V}} U_a = -(V^c \partial_c U_a + \partial_a V^c U_c)$

(Class-7) Lecture 4: Wed, June 18, 2025

**Covariant Derivative****Deriving Lie Derivative from the Vector Field**

- Vector field maps from manifold to manifold.
- All Lie groups are manifolds, but all manifolds are not Lie groups.
- Lie derivative can be defined on any manifold.
- In a manifold, there is no composition rule.

## Previous class discussion

- Adjoint map and Lie derivative are not same.

Adjoint definition :

$$\langle v, A \rangle = \langle A^* v, u \rangle$$

Whereas, Lie derivative:

$$\mathcal{L}_v u = -[u, v] = [v, u]$$

- Lie derivative and Lie algebra are not same.

$$f = f(x, y) \quad ; \quad g = g(x, y)$$

$$\begin{aligned} f &= f(x, y) \quad ; \quad g = g(x, y) \\ v &= f \frac{\partial}{\partial x} + g \frac{\partial}{\partial y} \\ [v, v'] &= \frac{\partial f}{\partial x} \frac{\partial g}{\partial y} - \frac{\partial g}{\partial x} \frac{\partial f}{\partial y} \end{aligned} \tag{7.1}$$

This (7.1) is not constant for Lie derivative. However,

$$[T^a, T^b] = f^{ab}{}_c T^c \tag{7.2}$$

The term  $f^{ab}{}_c$  in (7.2) is **constant** in Lie algebra or Lie group.Now,  $\xi^a$  = local cartesian coordinate. We know that,

$$ds^2 = (d\xi^a)^2 = \delta_{ab} d\xi^a d\xi^b \tag{7.3}$$

But we also know that,

$$\begin{aligned} d\xi^a &= \frac{\partial \xi^a}{\partial x} dx^m \\ \Rightarrow d\xi^a &= M^a{}_m dx^m \\ \therefore dx^m &= (M^{-1})^m{}_a d\xi^a \end{aligned} \tag{7.4}$$

**Notes :**

- A vector has to transform according to (7.4).
- If  $M^{-1}$  doesn't exist, we can only go to one way, known as singular. Example - the origin.

Using (7.4) to (7.3) we get

$$\begin{aligned} ds^2 &= \delta_{ab} \frac{\partial \xi^a}{\partial x^m} \frac{\partial \xi^b}{\partial x^n} dx^m dx^n \\ \therefore ds^2 &= G_{mn} dx^m dx^n ; \quad G_{mn} = G_{nm} \quad (\text{symmetric}) \end{aligned}$$

If such symmetric  $G_{mn}$  exists which is also invertible, the manifold is called **Riemannian manifold**.

Since  $ds^2$  is a scalar, it can also be given as:

$$\langle v, u \rangle \equiv g_{ab} V^a V^b$$

## 7.1 Killing Vector

[It is connected to symmetry hence related to a conserved quantity via Noether's theorem.]

**Definition:** A vector field  $X$  on  $M$  is called a Killing vector field if the Lie derivative of the metric with respect to  $X$  is zero:

$$\mathcal{L}_X g_{ab} = 0$$

This means that the metric doesn't change along the flow of  $X$ , i.e., distances and angles are preserved under the transformation generated by  $X$ .

### Cyclic Coordinates

A cyclic coordinate is a generalized coordinate  $q_i$  that doesn't appear explicitly in the Lagrangian  $\mathcal{L}(q, \dot{q}, t)$ .

$$\frac{\partial \mathcal{L}}{\partial q_i} = 0$$

Which implies  $q_i$  is cyclic.

Also,

$$[\mathcal{L}_u, \mathcal{L}_v] = \mathcal{L}_{[u,v]}$$

Two Killing vectors also constitute another Killing vector.

## 7.2 Covariant Derivative

1. It has to satisfy Leibniz rule (Derivative).
2. Mapping from algebra to algebra.

Now,  $D : A \rightarrow A$

$$D(ab) = (Da)b + a(Db) ; \quad a, b \in A$$

For a constant  $c$ ,

$$D(ca) = (Dc)a + c(Da) = c(Da)$$

$\therefore (Dc)$  needs to be zero for a constant  $c$

Also,

$$Dg_{ab} = 0 \Rightarrow \nabla_m g_{ab} = 0$$

- $\nabla \rightarrow$  generic case
- $\partial \rightarrow$  flat space only

When  $\nabla_a$  hits a scalar  $\phi$ , it produces a vector:

$$\nabla_a \phi = \partial_a \phi \quad (\text{vector})$$

But,

$$\nabla_a u^b \neq \partial_a u^b \quad \text{in this way.}$$

Like,

$$\begin{aligned} U^b &\rightarrow U'^c = M^c_b U^b \\ \Rightarrow \partial'_d U'^c &= \partial'_d (M^c_b U^b) \\ \Rightarrow \partial'_d U'^c &= M^c_b \partial'_d U^b + (\partial'_d M^c_b) U^b \end{aligned}$$

Here exist an additive part,  $(\partial'_d M^c_b) U^b$  that is the problem part which keeps the traces of previous map, mixing of objects of different type. Therefore, to kill it, we need to get:

$$\partial'_d M^c_b = 0.$$

Hence,

$$\nabla'_a (MU) = M \nabla_a U \quad \text{and} \quad \nabla'_a \rightarrow M^{-1} \nabla_a M.$$

Now,

$$\nabla_a = \partial_a + A_b$$

This  $A_b$  is the additive part called the connection. In older books it was called **connexion**.

Also,

$$\begin{aligned} \nabla_a \phi &= \partial_a \phi \\ \Rightarrow \nabla_a U^b &= \partial_a U^b + \Gamma_a^b{}_c U^c \\ \Rightarrow \nabla_a V_b &= \partial_a V_b - \Gamma_{ab}^c V_c \end{aligned} \tag{7.5}$$

The connection in (7.5) is called *Levi-Civita connection*. Now let,

$$\begin{aligned} U^a \nabla_a &= \phi \\ \Rightarrow \nabla_c(U^a \nabla_a) &= \partial_c \phi \\ \Rightarrow (\nabla_c U^a) \nabla_a + U^a (\nabla_c \nabla_a) &= \partial_c \phi \end{aligned}$$

Then,

$$\begin{aligned} \nabla_a(V_b W_c) &= (\nabla_a V_b) W_c + V_b (\nabla_a W_c) \\ &= \partial_a(V_b W_c) - \Gamma_{ab}^d V_d W_c - \Gamma_{ac}^d V_b W_d \\ \therefore \nabla_a g_{bc} &= \partial_a g_{bc} - \Gamma_{ab}^d g_{dc} - \Gamma_{ac}^d g_{bd} \end{aligned}$$

Previously, we know that:

$$\begin{aligned} \mathcal{L}_V W_a &= V^c \partial_c W_a + W_c \partial_a V^c \\ \therefore \mathcal{L}_V U^a &= V^c \partial_c U^a - U^c \partial_c V^a \end{aligned}$$

HW

- Calculate  $\mathcal{L} g_{ab}$  **Hint** : Let choose,

$$g_{ab} = P_a Q_b$$

$$\begin{aligned} \mathcal{L}_v(P_a Q_b) &= (\mathcal{L}_v P_a) Q_b + P_a (\mathcal{L}_v Q_b) \\ \mathcal{L}_v g_{ab} &= V^c \partial_c g_{ab} + g_{ac} \partial_b V^c + g_{cb} \partial_a V^c \end{aligned}$$

- Verify if the partial derivative is switched with the covariant derivative ( $\partial \rightarrow \nabla$ ) the Lie derivative won't change.

Here one way is given for the second task,

$$\begin{aligned} \mathcal{L}'_V U^a &= V^c \nabla_c U^a - U^c \nabla_c V^a \\ &= V^c (\partial_c U^a + \Gamma_c{}^a{}_b U^b) - U^c (\partial_c V^a + \Gamma_c{}^a{}_b V^b) \\ &= (V^c \partial_c U^a - U^c \partial_c V^a) + \Gamma_c{}^a{}_b U^b V^c - \Gamma_c{}^a{}_b U^c V^b \\ &= \mathcal{L}_V U^a + \Gamma_c{}^a{}_b U^b V^c - \Gamma_b{}^a{}_c U^b V^c \\ &= \mathcal{L}_V U^a \quad [\Gamma_c{}^a{}_b = \Gamma_b{}^a{}_c] \quad (\text{Torsion-free condition}) \\ \therefore \mathcal{L}'_V U^a &= \mathcal{L}_V U^a \end{aligned}$$

One covariant derivative and another covariant derivative is related with their connection:

$$\begin{aligned} [\nabla_a, \nabla_b] \phi &= 0 \\ [\partial_a, \partial_b] \phi &= 0 \end{aligned}$$

Also,

$$\begin{aligned} \nabla_c (g_{ab} U^b) &= g_{ab} (\nabla_c U^b) + (\nabla_c g_{ab}) U^b \\ &= g_{ab} \nabla_c U^b \end{aligned}$$

This suggests that the latter term must be zero,

$$\boxed{\nabla_c g_{ab} = 0}$$

This is known as the **Metricity condition**.

(Class-8) Lecture 5: Sat, June 21, 2025

## Classical Field Theory

Recall the Line element:

$$ds^2 = g_{ab} dx^a dx^b$$

### Notes

In GR, one takes  $g_{ab} = g_{ab}(x)$  itself as a dynamical field:  $g_{ab}(x) = g_{ba}(x)$   
Also, in the **Finsler metric**  $g$  not only depends on  $x$  but also the derivative,

$$g_{ab} = g_{ab}(x, \partial x)$$

It is used in transportation.

Now,

$$g'_{ab}(x') = g_{mn} \frac{\partial x^m}{\partial x'^a} \frac{\partial x^n}{\partial x'^b}$$

$$G \rightarrow G' = M^T G M \quad ; \quad M = \frac{\partial x}{\partial x'}$$

From multivariable calculus,

$$\begin{aligned} d^n x \rightarrow d^n x' &= \left| \frac{\partial x'}{\partial x} \right| d^n x \\ \Rightarrow d^n x' &= \det(M^{-1}) d^n x = \frac{1}{\det(M)} d^n x \\ \Rightarrow \frac{\partial x'}{\partial x} &= \det \left( \frac{\partial x'^m}{\partial x^n} \right) \end{aligned}$$

(Jacobian) Now,

$$\begin{aligned} \det(G') &= \det(M^T G M) = \det(M^T) \det(G) \det(M) \\ &= [\det(M)]^2 \det(G) \\ \therefore \sqrt{\det(G')} &= |\det(M)| \sqrt{\det(G)} \\ \Rightarrow \sqrt{g'} d^n x' &= \sqrt{g} d^n x \end{aligned}$$

$\therefore \sqrt{g} d^n x$  is an invariant volume element

### 8.1 DeWitt Notation

$$a \cdot b = a_\mu b^\mu$$

Quantum Mechanics (QM) says, in the Schrödinger picture:

$$\begin{aligned} \psi(x) &= \langle x | \psi \rangle \rightarrow x \text{ component of } \psi \\ \Rightarrow \langle \phi | \psi \rangle &= \int \langle \phi | x \rangle \langle x | \psi \rangle d\mu(x) \\ &= \int \phi^*(x) \psi(x) d\mu(x) = \phi_i^* \psi_i \rightarrow \text{DeWitt} \end{aligned}$$

## 8.2 Point vs Field

localized at only one point

$q(t, \sigma)$

Distributed over another one extra dimension.

Point  
begin{align\*} q(t) \end{align\*}

Field  
begin{align\*} \phi(t, x^i) \end{align\*}

- **Point:**  $q(t)$ , in only one point.
- **Field:**  $\phi(x) = \phi(t, x^i)$

Now action,

$$S = \int \mathcal{L} dt = \int \left[ \int d^3x \mathcal{L}[\phi] \right] dt$$

**Tenet:**

- (a) Action is invariant under a set of transformations.
- Space-time symmetries (Poincaré and diffeomorphism)
  - Internal symmetries

$$ds^2 = (dt)^2 - dx \cdot dx \rightarrow \text{Automorphism}$$

Now,

$$\begin{aligned} t &\rightarrow -t & (\text{time reversal}) \\ x &\rightarrow -x & (\text{space inversion}) \end{aligned}$$

These are discrete symmetries — **no conserved quantity**. However if,

$$x'^\mu = (\Lambda w x)^\mu + aw^\mu \rightarrow \text{continuous symmetry}$$

According to Noether's theorem, there's a conserved quantity for **continuous symmetry**.

Notes

**Coleman–Mandula Theorem (No-go Theorem):**

A sarcastic way to put it is - Internal symmetry cannot be married off to space-time symmetry within the framework of Lie group theory. **Example:** Generators:

$$M = (J + P) + T$$

Can't write like this so that:

$$[J, T] \neq 0$$

and

$$JT^+ \left| -\frac{1}{2} \right\rangle = J \left| \frac{1}{2} \right\rangle$$

- (b)  $\delta S = 0 \rightarrow$  equation of motion  
(c)  $\mathcal{L}[\phi]$  will be a polynomial of  $\phi$  and its first-order derivative

Now the Potential,

$$V[\phi] = \phi^r + a\phi^3 + a'\phi^4 + \dots$$

not  $e^\phi$  or  $\sin \phi, \cos \phi$  since we can take it in 1+1 dimension (In case  $\phi(t, \sigma)$ )

**Example:**

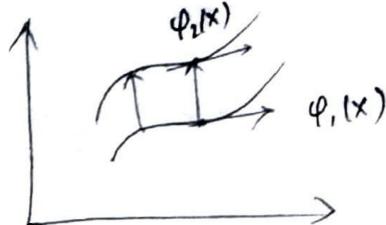

$$\begin{aligned} S[\phi] &= \alpha \phi_i \phi_i + \beta \partial \phi_i \partial \phi_i + \gamma_i \phi_i \\ &= \int d^4x [\alpha \phi(x) \phi(x) + \beta \partial_\mu \phi(x) \partial^\mu \phi(x) + \gamma_i(x) \phi_i(x)] \end{aligned}$$

[looking at this, it is too cumbersome without the DeWitt notation]

Now taking variation,

$$\delta S = 2\alpha \phi_i \delta \phi_i + 2\beta \partial \phi_i \delta(\partial \phi_i) + \gamma_i \delta \phi_i$$

The variation is assumed to be between two differentiable configurations.

$$\begin{aligned} \delta \phi(x) &= \phi_2(x) - \phi_1(x) \\ \Rightarrow \partial [\delta \phi(x)] &= \partial(\phi_2(x) - \phi_1(x)) \\ &= \partial \phi_2(x) - \partial \phi_1(x) \\ \therefore \partial(\delta \phi) &= \delta(\partial \phi) \end{aligned}$$

So, **variation and differentiation commute**. Hence,

$$\begin{aligned} \delta S &= 2\alpha \phi_i \delta \phi_i + 2\beta \partial \phi_i \delta(\partial \phi_i) + \gamma_i \delta \phi_i \\ &= (2\alpha \phi_i + \gamma_i) \delta \phi_i - 2\beta \partial^2 \phi_i \delta \phi_i + \int (\partial \phi_i \partial \phi_i) d^4x \Big|_{\text{boundary}} \\ &= \delta \phi_i (2\alpha \phi_i + \gamma_i - 2\beta \partial^2 \phi_i) \end{aligned}$$

Since  $\delta \phi_i$  is arbitrary,

$$\begin{aligned} 2\alpha \phi_i + \gamma_i - 2\beta \partial^2 \phi_i &= 0 \\ \Rightarrow (2\beta \partial^2 - 2\alpha) \phi_i &= \gamma_i \end{aligned}$$

- If  $\alpha = \alpha(x)$ :

$$(2\beta \partial^2 - 2\alpha)\phi_i = \gamma_i \quad (\text{No problem})$$

- If  $\beta = \beta(x)$ :

$$2\partial(\beta \partial\phi_i) - 2\alpha_i\phi_i = \gamma_i$$

To match with the Klein-Gordon equation:,

$$(\partial^2 + m^2)\phi = 0$$

We need

$$\begin{aligned} 2\beta &= +1 \\ 2\alpha &= -m^2 \\ \gamma &= 0 \end{aligned}$$

**Exercise:** Do the similar procedure for this action -

$$S[\phi] = \alpha \phi_i \phi_i + \beta \partial\phi_i \partial\phi_i + \gamma_i \phi_i + K_i \partial\phi_i$$

**Note:** The last term is important for  $\pi$ -meson.

### Note

A huge problem in Quantum Mechanics is linear independence which results in the potential  $V(x)$ .  $V(x)$  is not being spacetime invariant. A fundamental theory should not have the potential  $V(x)$ .

### Klein-Gordon Action:

$$\begin{aligned} S &= \frac{1}{2}(\partial\phi)^2 - \frac{1}{2}m^2\phi^2 + J\phi \\ &= \int d^4x \left[ \frac{1}{2}\partial_\mu\phi \partial^\mu\phi - \frac{1}{2}m^2\phi^2 + J(x)\phi(x) \right] \end{aligned}$$

### 8.3 Electromagnetism

Equation of Motion (EOM):

$$\partial_\mu F^{\mu\nu} = j^\nu \quad \rightarrow \quad 4 \text{ equations}$$

Where,

$$F^{\mu\nu} = \partial^\mu A^\nu - \partial^\nu A^\mu$$

$$\vec{B} = \vec{\nabla} \times \vec{A}$$

$$\vec{E} = -\vec{\nabla} A_0 - \frac{\partial \vec{A}}{\partial t}$$

Thus we get two sets of equations from the equation of motion:

$$\vec{\nabla} \cdot \vec{E} = \frac{\rho}{\epsilon_0} \quad (\text{M1})$$

$$\vec{\nabla} \times \vec{B} = \mu_0 \vec{j} + \frac{\partial \vec{E}}{\partial t} \quad (\text{M3})$$

The remaining two are found from:

$$\partial_{[\mu} F_{\nu\lambda]} = \partial_\mu F_{\nu\lambda} + \partial_\nu F_{\lambda\mu} + \partial_\lambda F_{\mu\nu} = 0 \quad [\text{Bianchi identity}]$$

$$\vec{\nabla} \cdot \vec{B} = 0 \quad (\text{M2})$$

$$\vec{\nabla} \times \vec{E} = -\frac{\partial \vec{B}}{\partial t} \quad (\text{M4})$$

### Notes

- There are total 8 Maxwell's (scalar) equations — 2 scalar divergence equations, 6 scalar components from the 2 vector curl equations.
- The vector equations evolve with time; their validity is confirmed from the previous two equations.
- Maxwell's EOM are equivalent to Hamilton's EOM, not the Lagrange's.

Now for the action,

$$S = \int \mathcal{L}(\phi, \partial\phi) \sqrt{-g} d^4x$$

The determinant of  $g$  is negative so we put a minus sign inside to make the  $(-g)$  positive. However we omit it in flat space:

$$\begin{aligned} \delta S &= \int \left[ \frac{\partial \mathcal{L}}{\partial \phi} \delta \phi + \frac{\partial \mathcal{L}}{\partial (\partial_\mu \phi)} \delta (\partial_\mu \phi) \right] d^4x \\ &= \int \left[ \frac{\partial \mathcal{L}}{\partial \phi} \delta \phi + \frac{\partial \mathcal{L}}{\partial (\partial_\mu \phi)} \partial_\mu (\delta \phi) \right] d^4x \\ &= \int \left[ \frac{\partial \mathcal{L}}{\partial \phi} - \partial_\mu \left( \frac{\partial \mathcal{L}}{\partial (\partial_\mu \phi)} \right) \right] \delta \phi d^4x + \int d^3x \eta^\mu \frac{\partial \mathcal{L}}{\partial (\partial_\mu \phi)} \delta \phi \\ &= 0 \quad \left( \int d^3x \eta^\mu \frac{\partial \mathcal{L}}{\partial (\partial_\mu \phi)} \delta \phi = 0 \rightarrow \text{Dirichlet condition} \right) \end{aligned}$$

### Verifying Dirichlet condition

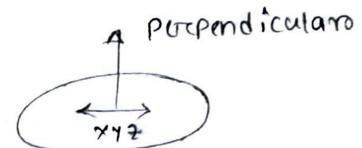

Let's verify this,

$$\begin{aligned} \nabla \cdot (\psi \nabla \phi) &= \nabla \psi \cdot \nabla \phi + \psi \nabla^2 \phi \\ \Rightarrow \int \nabla \phi \cdot \nabla \psi d^3x &= - \int \psi \nabla^2 \phi d^3x + \int \nabla \cdot (\psi \nabla \phi) d^3x \\ &= - \int \psi \nabla^2 \phi d^3x + \int \psi (n \cdot \nabla) \phi dS \end{aligned}$$

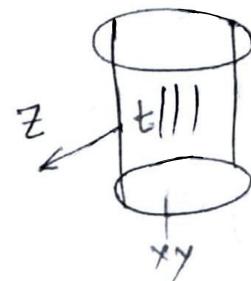

## Post-class discussions

**Time-like Space:**

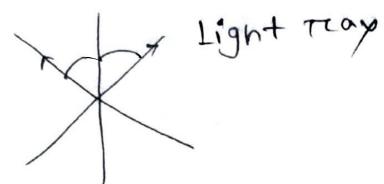

- Perpendicular is in time-like direction.

**Space-like Space:**

- Perpendicular is in z-direction.

**Null-like Space:**

- Null object's perpendicular is also null.
- E.g., light ray.

(Class-9) Lecture 6: Sat, June 28, 2025

## Gauge Theory

### 9.1 Gauge Field

#### 9.1.1 Free Field

Maxwell field  $\equiv$  EM field

Electromagnetism is **not** a theory of **field strength tensor**, but a **theory of potential**.

Now,

$$\mathcal{L} = -\frac{1}{4}F^{ab}F_{ab} \quad ; \quad F_{ab} = \partial_{[a}A_{b]} = \partial_a A_b - \partial_b A_a$$

Note about the factor  $-\frac{1}{2}$

- If we put  $\frac{1}{4}$  in the Lagrangian, the  $\frac{1}{2}$  is necessary in  $F_{ab}$ , otherwise we can omit it.
- ' $\frac{1}{2}$ ' was also used in Penrose's book

To find the equation of motion from the Lagrangian, we vary  $A$ ,

$$\begin{aligned} \delta\mathcal{L} &= -\frac{1}{4}F^{ab}\delta F_{ab} - \frac{1}{4}\delta F_{ab}F^{ab} \\ &= -\frac{1}{2}F_{ab}\delta F^{ab} \\ &= -\frac{1}{2}F_{ab}\delta(\partial^a A^b - \partial^b A^a) \\ &= -F_{ab}\delta(\partial^a A^b) \end{aligned} \tag{9.1}$$

$\therefore \delta\mathcal{L} = -F_{ab}\partial^a(\delta A^b) = 0$  [however,  $\delta A^b \neq 0$ ]  
 $\therefore \partial^a F_{ab} = 0$  (Free Maxwell Equation)

Derivation of (9.1)

$$F_{ab}(\partial^a C^b - \partial^b C^a) = F_{ab}\partial^a C^b - F_{ab}\partial^b C^a \tag{1}$$

$$= F_{ab}\partial^a C^b - F_{ba}\partial^a C^b \tag{2}$$

$$= F_{ab}\partial^a C^b + F_{ab}\partial^a C^b \quad [\because F_{ab} = -F_{ba}] \tag{3}$$

$$\therefore F_{ab}(\partial^a C^b - \partial^b C^a) = 2F_{ab}\partial^a C^b = 2F_{ab}\partial^a A^b \quad [C \rightarrow A] \tag{4}$$

#### 9.1.2 In Presence of a Source

$$\begin{aligned} \partial^a F_{ab} &= J_b \\ \Rightarrow \partial^a F_{ab} - J_b &= 0 \end{aligned}$$

and variation:

$$F_{ab}\partial^a(\delta A^b) - J_b\delta A^b = 0$$

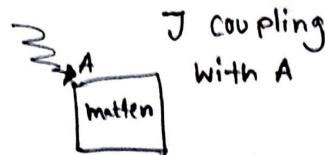

Thus in presence of a source the Lagrangian becomes,

$$\mathcal{L} = -\frac{1}{4}F_{ab}F^{ab} - J_b A^b$$

$J_b A^b \rightarrow$  Interaction term

### Notes

- Everything else other than the gauge field is matter.
- In the theory of gravitation, electromagnetism will act as a matter.

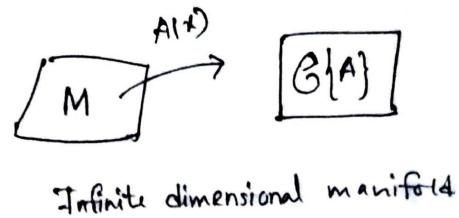

Therefore,

$$J^b = -\frac{\delta \mathcal{L}_{\text{matter}}}{\delta A^b(x)}$$

**Question:** When can a current couple to a photon?

**Answer:** Let's do a gauge transformation.

$$A_a \rightarrow A'_a = A_a + \partial_a F \quad (9.2)$$

### Notes

- It's like a translation in internal space.
- Translation of a configuration space.
- Transformation is thought as a translation in extra dimension.

Now, we want the action (Lagrangian) to be invariant under gauge transformation (9.2).

$$\begin{aligned} -J_b A^b &\rightarrow -J_b(A^b + \partial^b F) \\ &= -J_b A^b - J_b \partial^b F \\ &= -J_b A^b + (\partial^b J_b) F \quad [\text{integration by parts}] \end{aligned}$$

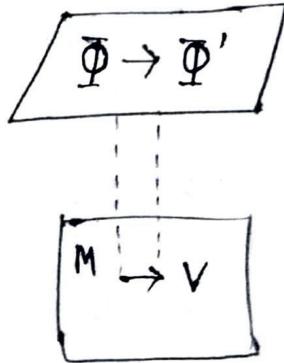

- $F$  must vanish on boundaries

- $F$  is not arbitrary.
- Therefore the current must be conserved.

$$\therefore \partial^b J_b = 0 \quad ; \quad \text{for all } J$$

- Classical EOM  $\neq$  Whole Configuration Space.
- Here, we extremize action.

## 9.2 Covariant Derivative

$$\phi \rightarrow \phi' = M\phi \quad ; \quad M = M(x)$$

$$\partial_\mu \phi \rightarrow \partial_\mu \phi' = \partial_\mu(M\phi) = M\partial_\mu \phi + (\partial_\mu M)\phi$$

The latter term  $(\partial_\mu M)\phi$  denotes there is another space dependency on  $\phi$

$M$  is a matrix valued. Now we have to add terms whose linear addition removes this garbage (extra term). Therefore,

$$D_\mu \phi \rightarrow MD_\mu \phi \equiv D'_\mu \phi' \equiv D'_\mu(M\phi)$$

Derivative is not hermitian, it is anti-hermitian. Hence we write,

$$D_\mu \phi = \partial_\mu \phi + iA_\mu \phi \quad \text{instead of} \quad \partial_\mu \phi + A_\mu \phi.$$

Also  $D_\mu$  is an associative operation.

$$\begin{aligned} D'_\mu b &= M D_\mu M^{-1} \\ \Rightarrow (\partial_\mu + iA'_\mu) &= M(\partial_\mu + iA_\mu)M^{-1} \\ \Rightarrow \partial_\mu + iA'_\mu &= \partial_\mu + i MA_\mu M^{-1} \quad [ : M\partial_\mu M^{-1} = \partial_\mu ] \\ \Rightarrow iA'_\mu &= M(\partial_\mu M^{-1}) + i MA_\mu M^{-1} \\ \Rightarrow iA'_\mu &= M\partial_\mu M^{-1} + i MA_\mu M^{-1} \\ \therefore A'_\mu &= MA_\mu M^{-1} - i M\partial_\mu M^{-1} \end{aligned}$$

**Findings:**

- $D$  is matrix valued.
- $D_\mu$  transforms covariantly  $\rightarrow$  Tensor
- $A_\mu$  doesn't transform covariantly  $\rightarrow$  Tensor

Now,

$$\begin{aligned}
 \tilde{F}_{\mu\nu} &= \frac{1}{i}[D_\mu, D_\nu] \\
 &= \frac{1}{i}[\partial_\mu \mathbb{I} + iA_\mu, \partial_\nu \mathbb{I} + iA_\nu] \\
 &= \frac{1}{i}\{i[\mathbb{I}\partial_\mu, A_\nu] + i[A_\mu, \mathbb{I}\partial_\nu] + i^2[A_\mu, A_\nu]\} \quad (\because [\partial_\mu, \partial_\nu] = 0) \\
 \therefore \tilde{F}_{\mu\nu} &= \partial_\mu A_\nu - \partial_\nu A_\mu + i[A_\mu, A_\nu] \\
 \therefore [D_\mu, D_\nu] &\text{ is a curvature}
 \end{aligned}$$

Now,

$$\begin{aligned}
 \tilde{F}_{\mu\nu} &= M F_{\mu\nu} M^{-1} \\
 &= -\frac{1}{i}[D_\mu, D_\nu] \\
 &= -\frac{1}{i}[M D_\mu M^{-1}, M D_\nu M^{-1}] \\
 &= -\frac{1}{i}M[D_\mu, D_\nu]M^{-1} \\
 \therefore \tilde{F}_{\mu\nu} &= M \tilde{F}_{\mu\nu} M^{-1}
 \end{aligned}$$

Now, for a transformation  $\phi \rightarrow \phi' = M\phi$

$$A_\mu \rightarrow M A_\mu M^{-1} - i M \partial_\mu M^{-1} \quad (9.3a)$$

$$\bar{A}_\mu \rightarrow M \bar{A}_\mu M^{-1} - i M \partial_\mu M^{-1} \quad (9.3b)$$

Subtracting (9.3b) to (9.3a) we get

$$(\bar{A}_\mu - A_\mu) \rightarrow M(\bar{A}_\mu - A_\mu)M^{-1}$$

Therefore, the variation  $(\bar{A}_\mu - A_\mu)$  of a connection acts as a tensor, not  $A_\mu$  itself.

#### Extra information

- Affine space:** the origin is not known.
- If  $A$  is a matrix, we can define some norm out of it:
  - $\det A \rightarrow$  not additive
  - $\text{Tr } A \rightarrow$  additive

Now,

$$\begin{aligned}
 S_{YM} &= -\frac{1}{4} \int d^D x \text{Tr}(\tilde{F}_{\mu\nu} \tilde{F}^{\mu\nu}) \\
 \delta S_{YM} &= -\frac{1}{2} \int d^D x \text{Tr}(\tilde{F}^{\mu\nu} \delta \tilde{F}_{\mu\nu}) = 0
 \end{aligned} \quad (9.4)$$

Here,

$$\begin{aligned}
\delta \tilde{F}_{\mu\nu} &= \frac{1}{i} \delta [D_\mu, D_\nu] \\
&= \frac{1}{i} \delta (D_\mu D_\nu - D_\nu D_\mu) \\
&= \frac{1}{i} \{ (\delta D_\mu) D_\nu + D_\mu (\delta D_\nu) - (\delta D_\nu) D_\mu - D_\nu (\delta D_\mu) \} \\
&= -\frac{1}{i} \{ [\delta D_\mu, D_\nu] + [D_\mu, \delta D_\nu] \} \\
&= [\delta A_\mu, D_\nu] + [D_\mu, \delta A_\nu] \\
\therefore \delta \tilde{F}_{\mu\nu} &= [D_\mu, \delta A_\nu] - [D_\nu, \delta A_\mu]
\end{aligned} \tag{9.5}$$

Recall for electromagnetism,

$$\delta F_{\mu\nu} = \partial_\mu (\delta A_\nu) - \partial_\nu (\delta A_\mu) = [\partial_\mu, \delta A_\nu] - [\partial_\nu, \delta A_\mu]$$

Using (9.5) in (9.4) we get,

$$\begin{aligned}
\delta S_{YM} &= -\frac{1}{2} \int d^D x \text{Tr} \left( \tilde{F}^{\mu\nu} \{ [D_\mu, \delta A_\nu] - [D_\nu, \delta A_\mu] \} \right) \\
&= -\frac{1}{2} \int d^D x \text{Tr} \left( \tilde{F}^{\mu\nu} [D_\mu, \delta A_\nu] - \tilde{F}^{\mu\nu} [D_\nu, \delta A_\mu] \right) \\
&= -\int d^D x \text{Tr} \left( \tilde{F}^{\mu\nu} [D_\mu, \delta A_\nu] \right) \\
\therefore \delta S_{YM} &= \int d^D x \text{Tr} \left( [D_\mu, \tilde{F}^{\mu\nu}] \delta A_\nu \right) = 0
\end{aligned}$$

$$\therefore [D_\mu, F^{\mu\nu}] = 0 \quad (\tilde{F}_{\mu\nu} \rightarrow A^1 + A^2 \rightarrow A^3 \quad \text{highly nonlinear})$$

Proof of (9.5),

$$\text{Tr}(A[X, B]) = -\text{Tr}([X, A]B)$$

$$\begin{aligned}
\text{Tr}(A[X, B]) &= \text{Tr}(AXB - ABX) \\
&= \text{Tr}(XAB) + \text{Tr}(AXB) \\
&= -\text{Tr}(\{XA - AX\}B)
\end{aligned}$$

$$\therefore \text{Tr}(A[X, B]) = -\text{Tr}([X, A]B)$$

$$\therefore \text{Tr}(\tilde{F}_{\mu\nu} [D_\mu, \delta A_\nu]) = -\text{Tr}([D_\mu, \tilde{F}_{\mu\nu}] \delta A_\nu)$$

(Class-10) Lecture 7: Sat, July 5, 2025

## Path Integral Formalism

### 10.1 Quantization

#### 10.1.1 What is Quantization?

In quantum mechanics, canonical quantization is a recipe that takes us from the Hamiltonian formalism of classical dynamics to the quantum theory. The recipe tells us to take the generalized coordinates  $q_a$  and their conjugate momenta  $p^a$  and promote them to operators.

**Example:** In the harmonic oscillator, we quantize by defining:

- Ladder operators:  $a, a^\dagger$
- Number states:  $|n\rangle$

Then, we can calculate overlaps like:

$$\langle m | e^{i\hat{H}t/\hbar} | n \rangle$$

#### Overlaps

In quantum mechanics, states are represented as vectors in a Hilbert space. The overlap between two quantum states  $|\psi\rangle$  and  $|\phi\rangle$  is their inner product:

$$\langle \phi | \psi | \phi | \psi \rangle \quad (\text{Complex number})$$

This is only possible because we quantized—i.e., built a Hilbert space of states and defined how operators act.

**No Hilbert Space = No quantization.**

#### 10.1.2 Why Quantization?

- Matches with experimental results.
- The ultimate goal is to calculate **overlaps**. No operators / Hilbert space is necessarily involved.

#### Note

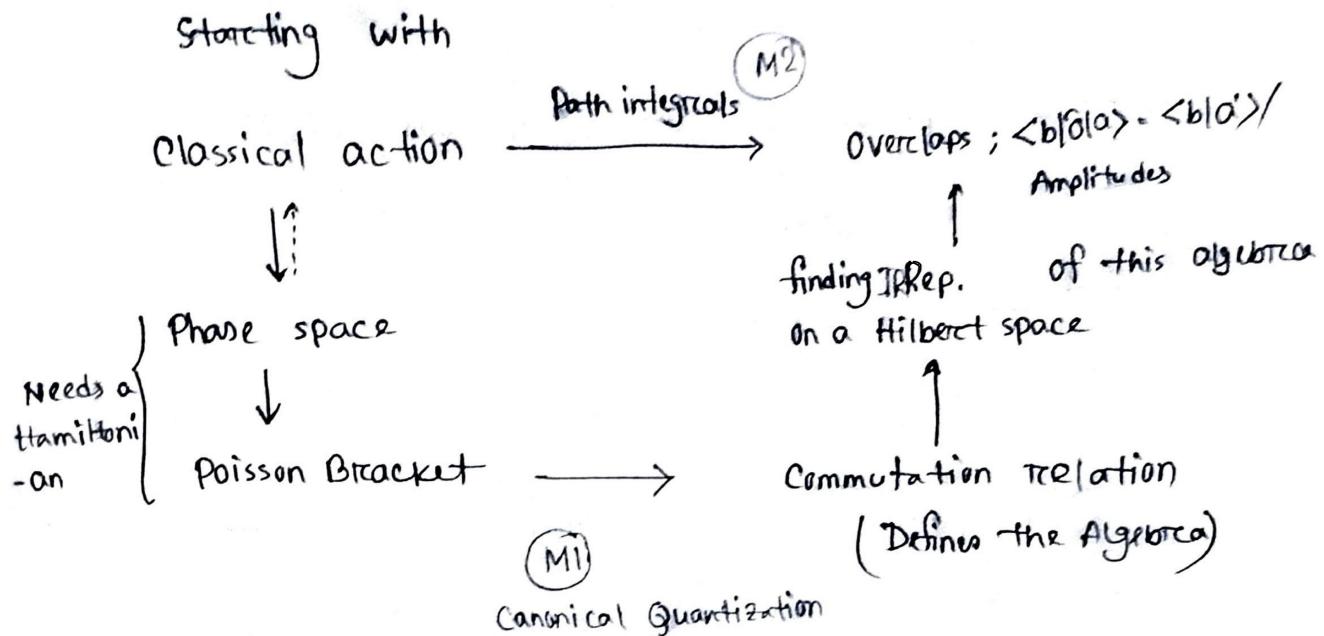

**Why in quantum mechanics we take  $[a, a^\dagger] = 1$  but why not  $a^\dagger |0\rangle = 0$ ?**

Because if  $a^\dagger |0\rangle = 0$ , then:

$$(x + ip)\psi = 0 \quad \Rightarrow \quad \left( x - \frac{d}{dx} \right) \psi = 0$$

If  $\psi \sim Ae^{+x^2/2}$ , it won't be normalizable.

## 10.2 Quantization Methods

### GNS Construction

GNS Construction : Algebra  $\rightarrow$  Hilbert space

Regular Representation of a Group (Algebra):

$$gg' = g'g$$

Think of a vector:

$$R(g) \begin{pmatrix} g_1 \\ g_2 \\ \vdots \\ g_n \end{pmatrix} = \begin{pmatrix} g'_1 \\ g'_2 \\ \vdots \\ g'_n \end{pmatrix}$$

- Regular representation is not necessarily an irreducible representation (irrep).

### Adjoint Representation

$$[T(g), g] = g''$$

- Adjoint Rep. is an irrep.

Also,

*Algebra*  $\rightarrow$  existence of a cyclic vector  $\equiv$  choice of a vacuum state

## Back to Hamiltonian Formulation

The Hamiltonian depends on a choice of coordinates. It's not a covariant concept.

1. We find  $H$  from conjugate momenta.
2. Then need Lagrangian  $\mathcal{L}$
3. Then need **dot** i.e., time derivatives
4. Which is frame dependent
5. Proper time needs to be defined

Hence, not good from the vantage point of General Relativity.

### Haag's Theorem

**Statement:** The interaction picture does not rigorously exist in interacting relativistic quantum field theory.

### 10.3 Pictures in Quantum Mechanics

Pictures	State	Operator
Schrödinger	✓	✗
Heisenberg	✗	✓

QFT → Infinite Degrees of Freedom

**Schrödinger Picture:** Needs a state vector which is a **functional** of the degrees of freedom (DOFs).

In one particle,

- $\hat{x} \rightarrow$  can be independent of time
- $\psi \rightarrow$  can be time dependent

$\therefore \hat{x}|\psi\rangle \rightarrow$  eigenvalue can be dependent on time.

In Quantum Field Theory,

$$\psi(x) \rightarrow \psi[\phi]$$

This is because  $x$  is just a **label**, so relabeling does not change the wavefunction.

Also for one particle,

$$\psi \sim e^{-x^2/2}$$

But for many particles,

$$\psi \sim e^{-x_1^2/2} \cdot e^{-x_2^2/2} \dots \dots \sim \prod_i e^{-x_i^2/2}$$

For Hamiltonian:

$$H = \sum_i p_i^2 + V = - \sum_i \left( \frac{\partial^2}{\partial x_i^2} \right) + V$$

As we can see there are infinite derivatives  $\left( \frac{\partial}{\partial x} \right)$  and we need to find their eigenvalues. This is why the Heisenberg picture is often preferred where, **states are independent of time**.

**Notice, in Quantum Mechanics:**

$$[x_i, p_j] = i\hbar\delta_{ij}$$

- Eigenvalues are unbounded -  $1 \leq i, j \leq \mathbb{N}$  - Degrees of freedom are **finite**

beginalign\*1em]

**In Quantum Field Theory:**

$$[\phi(x), \pi(y)] = i\delta^3(x - y)\hat{\mathbb{I}}$$

- Degrees of freedom are **infinite** - Representations of the commutation relations are **not unitarily equivalent**

beginalign\*1em]

**Another way to realize this:**

$$[x_i, p_j] = i\hbar\delta_{ij}$$

The trace of the right-hand side is non-zero:

$$\text{Tr}(\hat{\mathbb{I}}) \neq 0$$

But the trace of the left-hand side:

$$\text{Tr}(xp - px) = \begin{cases} 0 & (\text{finite d.o.f.}) \\ \neq 0 & (\text{infinite d.o.f.}) \end{cases}$$

We use the Heisenberg picture,

**Free Particle Wavefunction**

$$\begin{aligned}
\psi(x, t) &= e^{i(kx - \omega t)} \\
&= e^{\frac{i}{\hbar}(px - Et)} \\
&= e^{\frac{i}{\hbar} \int (p \frac{dx}{dt} - E) dt} \\
&= e^{\frac{i}{\hbar} \int \mathcal{L} dt} \\
&= e^{\frac{i}{\hbar} S}
\end{aligned}$$

Also,

$$\psi(x, t) = \langle x | \psi, t | x | \psi, t \rangle_S = \langle x, t | \psi | x, t | \psi \rangle_H$$

We are interested in this "kernel":

$$\langle x', t' | x, t | x', t' | x, t \rangle$$

**Why This Kernel?**

We assume we are dealing with linear equations:

$$\hat{L}\phi(x) = J(x) ; \text{ Effect} \rightarrow \text{Cause} \quad (10.1)$$

Recall Ohm's law:

$$\begin{aligned}
J &= \sigma E \\
\Rightarrow J(x) &= \sigma(x)E(x) \quad (\text{Local, like Maxwell's equations}) \\
\text{But, } V &= IR \quad (\text{Bilocal: Involves two points})
\end{aligned}$$

Inversion of (10.1) yields:

$$\phi(x) = \int G(x, y)J(y) dy$$

Where:

- $G(x, y)$ : Green's Function (Kernel)
- $\hat{L}G(x, y) = \delta(x, y)$  (not  $\delta(x - y)$ )

Effect at point  $x$  caused by a source of unit strength localized at point  $y$ . That is:

$$\langle b | V | a \rangle$$

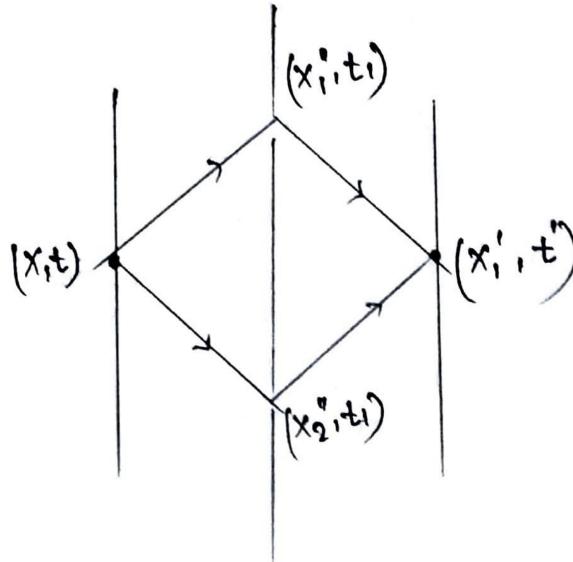

**Important Notes:**

- $\delta(x, y) \rightarrow$  Localized cause
- $G(x, y)$  is not necessarily symmetric
- Operator  $\hat{L}$  possesses translation symmetry

Checking (10.1):

$$\begin{aligned}\hat{L}\phi(x) &= \int \hat{L} G(x, y) J(y) dy \\ &= \int \delta(x, y) J(y) dy \\ &= J(x) \\ \therefore \phi(x) &= \int G(x, y) J(y) dy\end{aligned}$$

#### 10.4 Double Slit

$$\begin{aligned}\langle x', t' | x, t \rangle &= \sum_i \langle x', t' | x''_i, t_2 \rangle \langle x''_i, t_2 | x, t \rangle \\ &= \int dx'' \langle x', t' | x'' \rangle \langle x' | t \rangle\end{aligned}$$

**Completeness Theorem:**

$$\int dx'' |x''\rangle \langle x''| = \mathbb{I} \quad \rightarrow \quad \text{must be a complete set.}$$

All calculations hereafter are to be done on a discrete space-time and we will take the continuum limit.

Hence,

$$\langle x', t' | x, t \rangle = \int \prod_{i=1}^N dx_i \langle x', t' | x_{i-1} \rangle \langle x_{i-1} | x_{i-2} \rangle \langle x_{i-2} | \dots \rangle \langle x_1 | x, t \rangle$$

Now, we need to measure:

$$\langle x', t + \delta t | x, t \rangle$$

Recall,

$$\langle x, t | \psi \rangle_H = \langle x | \psi, t \rangle_S$$

Schrödinger equation:

$$\begin{aligned} i \frac{\partial}{\partial t} |\psi(t)\rangle &= \hat{H} |\psi\rangle \\ \Rightarrow |\psi(t)\rangle &= e^{-i\hat{H}t} |\psi(0)\rangle = e^{-i\hat{H}t} |\psi\rangle_H \\ \therefore \langle x|\psi, t\rangle_S &= \langle x|e^{-i\hat{H}t} |\psi\rangle_H \end{aligned}$$

$$\boxed{\therefore \langle x', t+dt|x, t\rangle = \langle x', \Delta t|x, 0\rangle = {}_H\langle x'|e^{-i\hat{H}t}|x\rangle_H}$$

[ here,  ${}_H\langle x'|e^{-i\hat{H}t}|x\rangle_H \rightarrow$  measure at the same time]

Note as  $\Delta t \rightarrow 0$ ,

$$\langle x', \Delta t|x, 0\rangle = \delta(x - x') \quad (\text{compare at the same time})$$

Hence,

$$\begin{aligned} \langle x'|e^{-i\hat{H}\Delta t}|x\rangle &= \int dp \langle x'|e^{-i\hat{H}\Delta t}|p\rangle \langle p|x\rangle \\ &= \int dp dp' \langle x'|p'\rangle \langle p'|e^{-i\hat{H}\Delta t}|p\rangle \langle p|x\rangle \\ &= \int dp dp' \frac{1}{2\pi} e^{ip'x'} \langle p'|e^{-i\hat{H}\Delta t}|p\rangle e^{-ipx} \\ &\quad [\because \langle x|p\rangle = \frac{1}{\sqrt{2\pi}} e^{ipx}; \hbar = 1] \\ &= \frac{1}{2\pi} \int dp dp' e^{i(p'x' - px)} \langle p'|e^{-i\hat{H}\Delta t}|p\rangle \end{aligned}$$

Now, for a free particle,

$$\hat{H} = \frac{\hat{p}^2}{2m} \quad [V(x) \text{ not discussed here}]$$

Hence,

$$\begin{aligned} \langle p'|e^{-i\hat{H}\Delta t}|p\rangle &= \langle p'|e^{-i\frac{\hat{p}^2}{2m}\Delta t}|p\rangle \\ &= e^{-i\frac{\hat{p}^2}{2m}\Delta t} \langle p'|p\rangle \\ &= e^{-i\frac{p^2}{2m}\Delta t} \delta(p - p') \end{aligned}$$

Therefore,

$$\begin{aligned} \langle x'|e^{-i\hat{H}\Delta t}|x\rangle &= \frac{1}{2\pi} \int dp dp' e^{i(p'x' - px)} e^{-i\frac{p^2}{2m}\Delta t} \delta(p - p') \\ &= \frac{1}{2\pi} \int dp e^{i(px' - px)} e^{-i\frac{p^2}{2m}\Delta t} \end{aligned}$$

Using the Gaussian integral identity:

$$\int_{-\infty}^{\infty} dz e^{-az^2 + bz} = \sqrt{\frac{\pi}{a}} e^{\frac{b^2}{4a}}$$

We get,

$$\begin{aligned}
&= \frac{1}{2\pi} \int dp e^{-(\frac{i\Delta t}{2m})^2 p^2} e^{ip[x' - x]} \\
&= \frac{1}{2\pi} \left( \frac{\pi}{\frac{i\Delta t}{2m}} \right)^{1/2} e^{-\frac{(x' - x)^2}{4i\Delta t/(2m)}} \\
&= \left( \frac{m}{2\pi i \Delta t} \right)^{1/2} e^{i \frac{m}{2} \left( \frac{x' - x}{\Delta t} \right)^2 \Delta t} \\
&= \left( \frac{m}{2\pi i \Delta t} \right)^{1/2} e^{i \frac{m}{2} v^2 \Delta t} \\
&= A e^{i \mathcal{L} \Delta t} ; \quad [A = \left( \frac{m}{2\pi i \Delta t} \right)^{1/2}]
\end{aligned}$$

So,

$$\langle x', t' | x, t \rangle = \int dx' dx'' \prod_i e^{im \left[ \frac{x_{i+1} - x_i}{2\Delta t} \right]^2} = \int \mathcal{D}x e^{iS[x]}$$

Where  $\mathcal{D}x$  is an infinite-dimensional factor.

***Green's Function in QFT***

### 11.1 Time-Ordered Products

In QFT, the time-ordered product of operators is an operation that arranges a sequence of field operators such that they are ordered with **decreasing time arguments** (latest time first).

#### Why do we need time-ordered products?

**Issue: 1**

We need the time-ordered product in QFT because, in the interaction picture, it ensures the correct chronological ordering of operators (as quantum operators do not commute) in *Dyson's formula*, which is essential for computing the perturbative expansion of the S-matrix while preserving causality.

For scattering, which is also an operator:

$$\hat{S} = \lim_{\substack{t_i \rightarrow -\infty \\ t_f \rightarrow +\infty}} \mathcal{U}(t_f, t_i) = \hat{T} \exp \left( -\frac{i}{\hbar} \int_{t_i}^{t_f} H_{\text{int}}(t) dt \right)$$

Here,  $\hat{T} \rightarrow$  amounts to time ordering operator  
 $\hat{S} \rightarrow$  also an operator

For additive systems:

$$\hat{T}[A + B] = \hat{T}[A] + \hat{T}[B]$$

Say, if we are dealing with an otherwise free scalar field interacting with a **classical source**  $J(x)$ , which can be thought of as disturbance from outside, then  $H_{\text{int}}(t)$  becomes:

$$H_{\text{int}}(t) = \int d^3x J(x) \hat{\phi}(x)$$

$J(x)$  is not an operator, it's just a classical source. It has no fluctuation in time.

$$\hat{S} = \hat{T} \left[ \exp \left( -i \int J(x) \hat{\phi}(x) d^4x \right) \right] ; \quad [\hbar = 1 \text{ hereafter}]$$

Expanding yields:

$$\begin{aligned} \hat{S} &= \hat{T} \left[ \sum_{n=0}^{\infty} \frac{(-i)^n}{n!} \prod_{i=1}^n \int d^4x_i [J(x_1)J(x_2) \cdots J(x_n) \hat{\phi}(x_1)\hat{\phi}(x_2) \cdots \hat{\phi}(x_n)] \right] \\ &= \sum_{n=0}^{\infty} \frac{(-i)^n}{n!} \prod_{i=1}^n \int d^4x_i [J(x_1)J(x_2) \cdots J(x_n) \hat{T} \hat{\phi}(x_1)\hat{\phi}(x_2) \cdots \hat{\phi}(x_n)] \end{aligned}$$

Here,  $\hat{T}$  will act only on the field operators.  $J(x_i)$  is not an operator at all. Hence,

$$\hat{T}[\phi(x)] = \phi(x) ; \text{ one field only, no time-ordering needed.}$$

$$\hat{T}[\phi(x_1)\phi(x_2)] = \theta(t_1 - t_2)\phi(x_1)\phi(x_2) + \theta(t_2 - t_1)\phi(x_2)\phi(x_1)$$

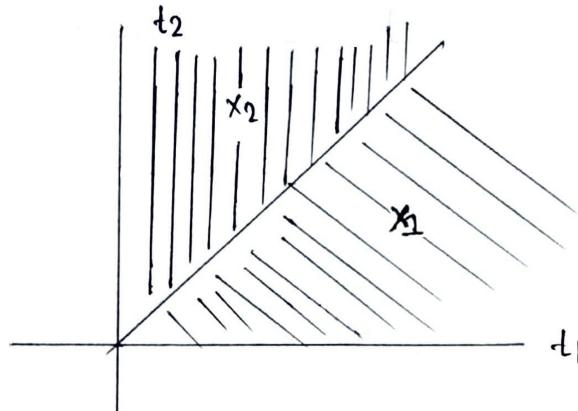

- $x_i = (t_i, \vec{x}_i)$  - For each field, a classical source is needed to generate it.
- $\theta$  (argument) =  $\theta(x)$  - This is called the **Heaviside Step Function**, a piecewise-defined function used to "turn on" expressions depending on the sign of its argument.

$$\theta(x) = \begin{cases} 1 & x > 0 \\ 0 & x < 0 \end{cases} \quad [\text{sometimes } \theta(0) = \frac{1}{2} \text{ is also used}]$$

•

$$\theta(t_1 - t_2) = \begin{cases} 1 & ; \text{ if } t_1 \text{ is later in time than } t_2 \\ 0 & ; \text{ if } t_1 \text{ is earlier} \end{cases}$$

- For bosonic field, there will be a “+ve” sign in between.
- For fermionic field, there will be a “-ve” sign in between.

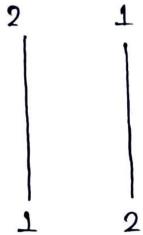

### Figure Explanation

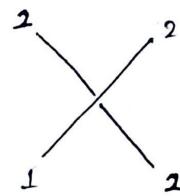

The diagram is a spacetime plot in the  $t_1 - t_2$  plane. Each point corresponds to a pair of times  $(t_1, t_2)$ .

- **Diagonal line:**  $t_1 = t_2$   
→ This is the boundary where both operators are evaluated at the same time.
- **Region above the diagonal:**  $t_2 > t_1$   
→ Labeled as  $x_2$ : corresponds to the  $\theta(t_2 - t_1)$  term.  
→ The time-ordered product becomes:  $\phi(x_2)\phi(x_1)$
- **Region below the diagonal:**  $t_1 > t_2$   
→ Labeled as  $x_1$ : corresponds to the  $\theta(t_1 - t_2)$  term.  
→ The time-ordered product becomes:  $\phi(x_1)\phi(x_2)$

## Pictorial View

for bosonic field,  
No overlapping.

for fermionic field,  
for each crossing, there will  
be a -ve sign.

Similarly, for three fields  $\phi(x_1), \phi(x_2), \phi(x_3) \equiv \phi_1, \phi_2, \phi_3$ , there are  $3! = 6$  permutations; so 6 terms will appear.

$$\begin{aligned}\hat{T}[\phi(x_1)\phi(x_2)\phi(x_3)] &= \theta(t_1 - t_2)\theta(t_2 - t_3)\phi_1\phi_2\phi_3 + \theta(t_1 - t_3)\theta(t_3 - t_2)\phi_1\phi_3\phi_2 \\ &\quad + \theta(t_2 - t_1)\theta(t_1 - t_3)\phi_2\phi_1\phi_3 + \theta(t_3 - t_2)\theta(t_2 - t_1)\phi_3\phi_2\phi_1 \\ &\quad + \theta(t_3 - t_1)\theta(t_1 - t_2)\phi_3\phi_1\phi_2 + \theta(t_2 - t_3)\theta(t_3 - t_1)\phi_2\phi_3\phi_1\end{aligned}$$

No need to give the hat sign again on operators ; as  $\hat{T}$  always acts on operators.

## 11.2 Green's Function

**Definition:** The vacuum expectation value of a time-ordered product of field operators is called a *Green's function* (or *correlation function*) in quantum field theory.

Therefore, for a scalar field  $\phi(x)$ , the 2-point Green function is:

$$G(x_1, x_2) = \langle 0 | \hat{T}[\phi(x_1)\phi(x_2)] | 0 \rangle$$

This is also called the *Feynman propagator*.

### Why do we need time-ordered products?

#### Issue: 2

For example, consider the Klein-Gordon (KG) field with no self-interaction. The action is:

$$S = -\frac{1}{2}\partial_\mu\phi_i\partial^\mu\phi_i - \frac{1}{2}m^2\phi_i^2$$

From this, the equation of motion will be:

$$(\square + m^2)\phi_i = 0 \Rightarrow (\partial^2 + m^2)\phi_i = 0$$

#### Reminder - DeWitt notation

$$\phi_i^2 = \phi_i\phi_i = \int \phi(x)\phi(x) dx$$

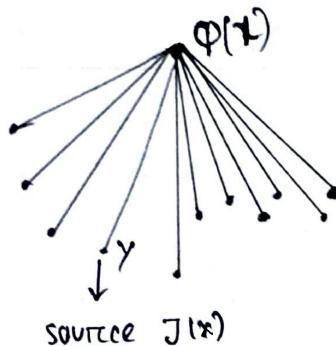

Now, if you need to observe something, you need interaction, which will change the energy or momentum of the system. Hence, in the presence of interaction, the equation of motion will become:

$$(\square + m^2)\phi_i = J_i$$

And the solution would be:

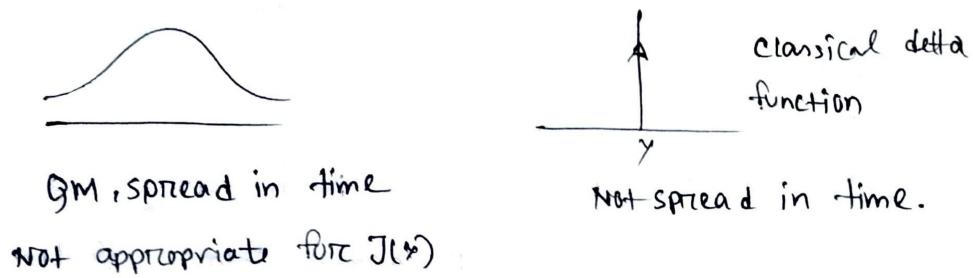

$$\phi_i = \phi_i^0 + \int G(x, y)J(y) d^4y$$

Where  $\phi_i^0$  is the solution in the absence of  $J$ . It is like the background/noise without the source. This equation is valid for linear superposition.

### Interpretation

Here,  $J(y)$  should be a classical source. When we have no idea of the input, but we want to calibrate the interacting system, then we need a source which is well defined and has no fluctuation if it exists at all.

### Question

How do we identify a QFT, and how do we say that we know a QFT?

### Answer

QFT is identified by all its Green's functions. Thus by knowing all the Green's functions, we can say that we know the theory is a QFT.

In free theory, it suffices to know the 2-point function  $J(x)$  to get the Green's function. Then the solution will be,

$$(\square + m^2)\phi_i = J_i - \lambda\phi_i^2 = J''$$

and

$$\phi_i = \phi_i^0 + \int G(x, y) [J(y) - \lambda \phi_i^2] d^4y$$

Therefore, in terms of Green's function, the equation of motion of the KG field will be -

$$(\square + m^2)G(x, y) = i \delta^4(x - y)$$

where,

$$G(x - y) = \langle 0 | T[\phi(x)\phi(y)] | 0 \rangle ; \quad | 0 \rangle = \text{vacuum state}$$

In other words,  $G_F(x, y)$  is the solution to the inhomogeneous Klein-Gordon equation. It's the function that gives the response of the scalar field to a point-like source at  $y$ .

### Example: Harmonic Oscillator

We know that the differential equation for a driven harmonic oscillator,

$$\left( \frac{d^2}{dt^2} + \omega_0^2 \right) x(t) = \frac{f(t)}{m}$$

Now we define the Green's function  $G(t - t')$  as the solution to:

$$\left( \frac{d^2}{dt^2} + \omega_0^2 \right) G(t - t') = \delta(t - t')$$

which means the system's response to a point impulse at time  $t'$ .

And given:

$$\delta(t) = \frac{1}{2\pi} \int_{\mathbb{R} \equiv (-\infty, +\infty)} d\omega e^{i\omega t}$$

Setting  $t' = 0$ , then:

$$G(t) = \frac{1}{2\pi} \int_{\mathbb{R}} d\omega G(\omega) e^{-i\omega t}$$

Where  $G(\omega) \rightarrow 0$  as  $\omega \rightarrow \pm\infty$ , and  $\omega$  is the driving frequency.

Now, applying the operator  $\left( \frac{d^2}{dt^2} + \omega_0^2 \right)$  to both sides:

$$\begin{aligned} \left( \frac{d^2}{dt^2} + \omega_0^2 \right) G(t) &= \int_{-\infty}^{\infty} \frac{d\omega}{2\pi} G(\omega) \left( \frac{d^2}{dt^2} + \omega_0^2 \right) e^{-i\omega t} = \delta(t) \\ &\Rightarrow \int_{-\infty}^{\infty} \frac{d\omega}{2\pi} (-\omega^2 + \omega_0^2) G(\omega) e^{-i\omega t} = \frac{1}{2\pi} \int d\omega e^{-i\omega t} \\ &\Rightarrow (\omega_0^2 - \omega^2) G(\omega) = 1 \\ &\Rightarrow G(\omega) = \frac{1}{\omega_0^2 - \omega^2} \\ \therefore G(t) &= \frac{1}{2\pi} \int_{\mathbb{R}} \left( \frac{1}{\omega_0^2 - \omega^2} \right) e^{-i\omega t} d\omega \end{aligned}$$

## Quantization

First, the unequal-time commutation relation between  $\hat{x}$  and  $\hat{p}$  for a quantum harmonic oscillator will be as follows:

In the Heisenberg picture, the operators evolve with time, not the states. Therefore, the time evolution of an operator  $\hat{\mathcal{O}}$  is given by:

$$\hat{\mathcal{O}}(t) = e^{i\hat{H}t/\hbar} \hat{\mathcal{O}}(0) e^{-i\hat{H}t/\hbar}.$$

Now, for a harmonic oscillator with Hamiltonian:

$$\hat{H} = \frac{\hat{p}^2}{2m} + \frac{1}{2}m\omega^2\hat{x}^2$$

By solving the Heisenberg equations we get:

$$\begin{aligned} x(t) &= x(0) \cos(\omega t) + \frac{p(0)}{m\omega} \sin(\omega t) \\ \hat{p}(t) &= \hat{p}(0) \cos(\omega t) - m\omega \hat{x}(0) \sin(\omega t) \end{aligned}$$

Now,

$$\begin{aligned} [x(t), p(t')] &= \left[ x(0) \cos(\omega t) + \frac{p(0)}{m\omega} \sin(\omega t), p(0) \cos(\omega t') - m\omega x(0) \sin(\omega t') \right] \\ &= \cos(\omega t) \cos(\omega t') [x(0), p(0)] + \frac{\sin(\omega t) \cos(\omega t')}{m\omega} [p(0), p(0)] \\ &\quad - m\omega \cos(\omega t) \sin(\omega t') [x(0), x(0)] - \frac{\sin(\omega t) m\omega \sin(\omega t')}{m\omega} [p(0), x(0)] \\ &= \cos(\omega t) \cos(\omega t') (i\hbar) + \sin(\omega t) \sin(\omega t') (i\hbar) \quad (\because [x, p] = i\hbar; [p, x] = -i\hbar) \\ &= i\hbar [\cos(\omega t) \cos(\omega t') + \sin(\omega t) \sin(\omega t')] = i\hbar \cos(\omega(t-t')) \\ \therefore [x(t), p(t')] &= i\hbar \cos(\omega(t-t')) \end{aligned}$$

If  $t' = t$ , then  $\cos \omega(t-t') = 1$ .

$$\therefore [x(t), p(t)] = i\hbar \quad ; \quad \text{the usual result}$$

Hence, for a particle:

$$[x_i(t), p_j(t)] = i\hbar \delta_{ij}$$

For a field:

$$\begin{aligned} [\phi(\mathbf{x}), \pi(\mathbf{y})] &= i\hbar \delta^3(\mathbf{x} - \mathbf{y}) \quad \text{and,} \\ [\phi(\mathbf{x}), \phi(\mathbf{y})] &= [\pi(\mathbf{x}), \pi(\mathbf{y})] = 0 \end{aligned}$$

Recall:

$$\langle 0 | T[\phi(x)\phi(y)] | 0 \rangle = G(x-y)$$

Now:

$$\begin{aligned} &(\partial_x^2 + m^2) \langle 0 | T[\phi(x)\phi(y)] | 0 \rangle \\ &\Rightarrow \left( \frac{\partial^2}{\partial t_x^2} - \nabla_x^2 + m^2 \right) \langle 0 | \theta(t_x - t_y) \phi_x \phi_y + \theta(t_y - t_x) \phi_y \phi_x | 0 \rangle \end{aligned}$$

Breaking down the differentiation part: it is symmetric in  $x \leftrightarrow y$

$$(-\nabla_x^2 + m^2)[\theta(t_x - t_y)\phi(x)\phi(y)] = \theta(t_x - t_y)[(-\nabla_x^2 + m^2)\phi_1]\phi_2 \quad \text{and,}$$

$$\frac{\partial^2}{\partial t^2}[\theta(t_1 - t_2)\phi_1\phi_2]$$

Replacing  $\pi = \dot{\phi}$  and  $\phi(x_1) = \phi_1$ ,  $\phi(x_2) = \phi_2$ ,  $t_x = t_1$ ,  $t_y = t_2$ : Now,

$$\begin{aligned} & \partial_{t_1} [\delta(t_1 - t_2)\phi_1 + \theta(t_1 - t_2)\dot{\phi}_1] \phi_2 \\ &= [\delta'(t_1 - t_2)\phi_1 + \delta(t_1 - t_2)\dot{\phi}_1 + \theta(t_1 - t_2)\ddot{\phi}_1 + \delta(t_1 - t_2)\ddot{\phi}_1] \phi_2 \\ &= \delta'(t_1 - t_2)\phi_1\phi_2 + 2\delta(t_1 - t_2)\dot{\phi}_1\phi_2 + \theta(t_1 - t_2)\ddot{\phi}_1\phi_2 \end{aligned}$$

Where we used :

1. The derivative of step function is the delta function:

$$\frac{d\theta}{dt} = \delta(t)$$

- 2.

$$\frac{d^2}{dx^2}(uv) = \frac{d^2u}{dx^2} + 2\frac{du}{dx}\frac{dv}{dx} + \frac{d^2v}{dx^2}$$

Lesson: Path integrals naturally calculate the time-ordered correlators.

(Class-12) Lecture 9 : Sat, July 16, 2025

**Green's Function Continued**

Path integral begins by defining a partition function and postulated as:

$$Z[g] = \int \mathcal{D}\phi e^{iS[\phi,g]}$$

Here,  $\mathcal{D}\phi \equiv$  measure over paths = spacetime history  
 $g =$  a parameter, can also be a set  $g$  as well.

**Lemma:**

$$\int_{\text{all config}} \mathcal{D}F(x) \frac{\delta G[F(x)]}{\delta F} = 0$$

It follows from Newton's fundamental theorem of calculus:

$$\int_{x=a}^{x=b} \frac{dF}{dx} dx = F(b) - F(a)$$

Now,

$$\begin{aligned} \delta G[F(x)] &= G[F + \delta F] - G[F] \quad ; \quad \text{There will be NO variation in } x \text{ here.} \\ \Rightarrow \text{Frac} \delta G[F(x)] \delta F &= \lim_{\delta F \rightarrow 0} \text{Frac} G[F + \delta F] - G[F] \delta F(x) \end{aligned}$$

Hence,

$$G[F + \epsilon] - G[F] = 0$$

Because it is just translation in function. Therefore, the lemma follows: the space function to be considered is closed. Hence the result follows:

$$\begin{aligned} \int \mathcal{D}\phi e^{iS[\phi]} \frac{\delta [e^{\frac{i}{\hbar} S[\phi]}]}{\delta \phi} &= 0 \\ \Rightarrow i \int \mathcal{D}\phi e^{iS[\phi]} \frac{\delta S}{\delta \phi} &= 0 \end{aligned}$$

Under the assumption that this integral is dominated by a single configuration and the fact  $e^{iS[\phi]} \neq 0$ , hence

$$\frac{\delta S}{\delta \phi} = 0 \quad : \text{classical EOM.}$$

Now,

$$\begin{aligned} Z[J] &= \mathcal{N} \int \mathcal{D}\phi e^{i(S[\phi] + J\phi)} = e^{iW[J]} \quad \text{and} \\ J\phi &= \int d^4x J(x)\phi(x) \end{aligned}$$

The choice of the normalization constant  $\mathcal{N}$  will be fixed by demanding  $Z[0] = 1$  and  $W$  can be real or complex.

Now, if we want to have expectation value of  $\phi$ :

$$\langle \phi(J) \rangle = \int \mathcal{D}\phi \phi e^{i(S[\phi]+J\phi)} \Big|_{J=0}$$

Now, replacing  $\phi \rightarrow \frac{1}{i} \frac{\delta}{\delta J}$  and  $\frac{i}{\hbar} \longleftrightarrow 1$ , we get:

$$\begin{aligned} \langle \phi(J) \rangle &= \frac{1}{i} \int \mathcal{D}\phi \frac{\delta}{\delta J(x)} e^{i(S[\phi]+J\phi)} \\ &= \frac{1}{i} \frac{\delta}{\delta J(x)} \int \mathcal{D}\phi e^{i(S[\phi]+J\phi)} = \frac{1}{i} \frac{\delta}{\delta J} [e^{iW[J]}] \end{aligned}$$

Where  $J$  is the conjugate or the Fourier transform of  $\phi$ .

Now, from the previous lemma:

$$\begin{aligned} \int \mathcal{D}\phi \frac{\delta S}{\delta \phi} e^{i(S[\phi]+J\phi)} &= 0 \\ \Rightarrow \frac{\delta S}{\delta \phi} \Big|_{\phi \rightarrow \frac{1}{i} \frac{\delta}{\delta J}} \int \mathcal{D}\phi e^{i(S[\phi]+J\phi)} &= 0 \\ \Rightarrow \frac{\delta S}{\delta \phi} \Big|_{\phi \rightarrow \frac{1}{i} \frac{\delta}{\delta J}} e^{iW[J]} \mathbb{I} &= 0 \end{aligned}$$

Now lets look at,

$$\begin{aligned} \partial_x [e^{i\theta(x)} \psi(x)] &= (\partial_x e^{i\theta(x)}) \psi(x) + e^{i\theta(x)} \partial_x \psi(x) \\ &= e^{i\theta(x)} [\theta(x) + i(\partial_x \theta(x))] \psi(x) \end{aligned}$$

Applying this in the previous eqn we get,

$$\begin{aligned} e^{iW[J]} \left[ \frac{\delta S}{\delta \phi} \Big|_{\phi \rightarrow \phi_c + \frac{1}{i} \frac{\delta}{\delta J}} \right] \mathbb{I} &= 0 \\ \therefore \left[ \frac{\delta S}{\delta \phi} \Big|_{\phi \rightarrow \phi_c + \frac{1}{i} \frac{\delta}{\delta J}} \right] \mathbb{I} &= 0 \quad [\because e^{iW[J]} \neq 0] \end{aligned}$$

Not same as classical one. It's the quantum mechanically corrected classical equation. This is the Schwinger–Dyson equation.

### Example

#### 12.1 Anharmonic oscillator

:

$$S = \frac{1}{2} \partial\phi \partial\phi - \frac{1}{2} m\phi^2 - \frac{1}{3!} g\phi^3$$

(potential)

Now

$$\frac{\delta S}{\delta \phi} = (\partial^2 + m^2)\phi + \frac{g\phi^2}{2} = 0 \quad \rightarrow \quad \text{Classical EOM.}$$

Schwinger–Dyson equation for this system is obtained by shifting  $\phi$ ,

$$\phi : \phi \rightarrow \phi + \frac{1}{i} \frac{\delta}{\delta J}$$

Then,

$$\begin{aligned} & (\partial^2 + m^2) \left[ \phi + \frac{\hbar}{i} \frac{\delta}{\delta J} \right] + \frac{g}{2} \left( \phi + \frac{\hbar}{i} \frac{\delta}{\delta J} \right) \left( \phi + \frac{\hbar}{i} \frac{\delta}{\delta J} \right) \mathbb{I} = 0 \\ \Rightarrow & (\partial^2 + m^2) \phi \mathbb{I} + (\partial^2 + m^2) \frac{\hbar}{i} \frac{\delta}{\delta J} \mathbb{I} + \frac{g}{2} \phi^2 \mathbb{I} + \frac{g}{2} \left( \frac{1}{i} \frac{\delta}{\delta J} \right)^2 \mathbb{I} + \frac{g}{2} \left( \phi \frac{1}{i} \frac{\delta}{\delta J} + \frac{1}{i} \frac{\delta}{\delta J} \phi \right) \mathbb{I} = 0 \\ \Rightarrow & (\partial^2 + m^2) \phi + \frac{g\phi^2}{2} + \frac{\hbar}{2i} \frac{\delta\phi}{\delta J} = 0 \end{aligned}$$

(Class-13) Lecture 10 : Sat, Aug 2, 2025

**Green's Function (n-point)****13.1  $\phi^4$  Theory**

Recall from the previous class:

$$\left( \frac{\delta S}{\delta \phi} + J \right) \mathbb{I} \Big|_{\phi \rightarrow \phi_c + \frac{\hbar}{i} \frac{\delta}{\delta J}} = 0$$

The Lagrangian is

$$\mathcal{L} = \frac{1}{2} (\partial_\mu \phi)^2 - \frac{1}{2} m^2 \phi^2 - \frac{g}{4!} \phi^4$$

The equation of motion will be:

$$\left[ \left( (\square + m^2) + \frac{g}{3!} \phi^3 \right) \phi \right] \mathbb{I} \Big|_{\phi \rightarrow \phi_c + \frac{\hbar}{i} \frac{\delta}{\delta J}} = 0$$

This can also be written as  $(\phi \mathbb{I})$ .

Now, in particular, a shift is observed:

$$\begin{aligned} \frac{g}{3!} \phi^3 \mathbb{I} &= \frac{g}{3!} \left( \phi_c + \frac{\hbar}{i} \frac{\delta}{\delta J} \right) \left( \phi_c + \frac{\hbar}{i} \frac{\delta}{\delta J} \right) \phi_c \\ &= \frac{g}{3!} \left( \phi_c + \frac{\hbar}{i} \frac{\delta}{\delta J} \right) \left( \phi_c^2 + \frac{\hbar}{i} \frac{\delta \phi_c}{\delta J} \right) \\ &= \frac{g}{3!} \left[ \phi_c^3 + \underbrace{2 \frac{\hbar}{i} \phi_c \frac{\delta \phi_c}{\delta J} + \left( \frac{\hbar}{i} \right)^2 \frac{\delta^2 \phi_c}{\delta J^2}}_{\text{Quantum correction}} \right] \end{aligned}$$

**Why is the  $\frac{\delta \phi_c}{\delta J} = G_{ii} = G$  is the Green's function?**

Because we know,

$$\hat{A}\phi = J \quad ; \quad \phi = \phi_c + GJ \quad \therefore \frac{\delta \phi}{\delta J} = G$$

## A quick rundown to Statistical Mechanics

Partition function:

$$Z = \sum_{\text{configs}} e^{-\beta H} \rightarrow \int d(\text{phase space}) e^{-\beta H(p,q,\dots)} = e^{-\beta F}$$

Here,  $F$  = free energy. There are two kinds of free energy: **Helmholtz** and **Gibbs**. Also for this system, the Internal energy  $U$  is the Hamiltonian.

$$\begin{array}{|c|c|c|c|} \hline S & S & S & S \\ \hline \end{array} \dots U(S,V,N) \\ \lambda \\ U(\lambda S, \lambda V, \lambda N) = \lambda U(S, V, N)$$

Euler equation for a homogeneous function:

$$S \frac{\partial U}{\partial S} + V \frac{\partial U}{\partial V} + N \frac{\partial U}{\partial N} = U \\ \therefore ST - PV + \mu N = U \quad \left[ \frac{\partial U}{\partial S} = T, \quad \frac{\partial U}{\partial V} = -P \right]$$

This is called the Gibbs–Duhem equation. Here the  $S, V, N$  are pure extensive variables. After applying Legendre transformation, we can get:

$$\begin{array}{ccc} U(S,V) & \xrightarrow{\quad} & A(T,V) \text{ Helmholtz} \\ \downarrow & & \downarrow \\ H(S,P) & \xrightarrow{\quad} & G(T,P) \text{ Gibbs} \\ \text{Enthalpy (mixed)} & & \end{array}$$

- Enthalpy  $H(S, P)$  and Helmholtz energy  $A(T, V)$  both have extensive and intensive variables.
- Gibbs free energy  $G(T, P)$  contains only intensive variables.

## What is the Landau theory of phase transition?

→ The system can be considered as a field. Here,  $\phi$  is called the *order parameter* because it behaves differently in different phases. Also the Hamiltonian is not unique.

$$\uparrow \iff \downarrow \Rightarrow \Phi_{ab}$$

The relativistic superconductor is similar with QCD. Microscopic d.o.f = quark, gluon, but we see meson.

## Back to lecture

From the quantum field

$$\phi \rightarrow \phi_c + \frac{\hbar}{i} \frac{\delta}{\delta J}, \quad \phi_c \equiv \text{Landau order parameter}$$

$$H = H_0 + J\phi$$

Remember,  $E, H$  are the field  $J$ , and  $D, B$  are the induction (not field).

Then,

$$Z = e^{-\beta F} = e^{\beta A} \Rightarrow Z[J] = \int \mathcal{D}\phi e^{i(S+J\phi)} = e^{iW[J]}$$

**Note: All of these are Schwingerian ways of doing things.**

### 13.2 Free theory

Free theory means there is no interaction present. The action is written as:

$$S = \frac{1}{2} \phi^T A \phi + J^T \phi, \quad A = -(\square + m^2)$$

$$S = \frac{1}{2} (\partial\phi)^2 - \frac{1}{2} m^2 \phi^2, \quad A = (\square + m^2)$$

$$\therefore Z[J] = \int \underline{\mathcal{D}\phi} e^{\frac{1}{2} \phi^T A \phi + J^T \phi} \quad [\mathcal{D}\phi \equiv \prod \underline{d\phi}]$$

$A$  = symmetric matrix with *positive* eigenvalues.

$$\Lambda = \text{diag}(\lambda_1, \lambda_2, \lambda_3, \dots), \quad x^T Ax = y^T \Lambda y, \quad y = Rx, \quad R^T AR = \Lambda, \quad \text{Jacobian} = \det R$$

Hence,

$$\therefore Z[J] = \int \prod_{i=1}^N dx_i e^{-x^T Ax + b^T x}$$

Measure is rotation invariant.

Now, recall The integration for a multilinear function:

$$\begin{aligned} & \int \prod_i dy_i e^{-\lambda_i y_i^2 + (b'^T y)} \quad \text{where} \quad b' = R^T b \\ &= \prod_{i=1}^N \left( \frac{\pi}{\lambda_i} \right)^{1/2} \exp \left[ \frac{1}{4} b'^T A^{-1} b \right] \\ &= \frac{\pi^{N/2}}{\sqrt{\det A}} \exp \left[ \frac{1}{4} b'^T A^{-1} b \right] \end{aligned}$$

$$b^T b = b'^T R^T R b' = b'^T b'$$

This is for a real scalar field. If it was for complex scalar field, we would have  $2\sqrt{\det A}$  terms for both real and imaginary parts as:

$$\sqrt{\det A} \times \sqrt{\det A} = \det A$$

Now,

$$Z[J] = \frac{N [\prod_{i=1}^{\infty} \sqrt{\pi}]}{\sqrt{\det A}} e^{[\frac{1}{4} i J^T (\frac{2}{-i}) \frac{1}{A} i J]} = \frac{N}{\sqrt{\det A}} e^{-\frac{1}{2} J^T A^{-1} J}$$

Note: Everything we are writing are in DeWitt notation:

$$A \cdot B = \int d^4x \ A^m(x) B^n(x)$$

Aside, if  $A$  has a zero eigenvalue:

$$S = \frac{1}{2} \sum_{i=1}^N x^T A x + b^T x = \frac{1}{2} \sum_{i=2}^N \lambda_i y_i^2 + \dots$$

$$\int_{-\infty}^{\infty} \prod_{i=2}^N dy_i e^{(\dots)}$$

$y_1$  can be separated out so it won't blow up —  $\int_{-\infty}^{\infty} dy_1 = \infty$ , otherwise  $y_1 \rightarrow 0$  zero mode. If **NO** zero mode, we can expand each convergent term.

$n$ -point correlator:

$$\langle \phi_1 \phi_2 \dots \phi_N \rangle = \frac{1}{i^N} \frac{1}{Z[J]} \frac{\delta^n}{\delta J_1 \delta J_2 \dots \delta J_N} \Big|_{J=0} \equiv \langle 0 | T[\hat{\phi}_1 \hat{\phi}_2 \dots \hat{\phi}_N] | 0 \rangle$$

To normalize  $Z[J]$ , we need  $\langle \mathbb{I} \rangle = 1$  and we will demand  $Z[0] = 1$ . We also use the assumption:  $\hat{A}$  is independent of  $J$ .

$$Z[J] = e^{-\frac{i}{2} J_x (A^{-1})_{xy} J_y} ; \quad J_x (A^{-1})_{xy} J_y = \int d^D x d^D y J(x) (A^{-1})_{xy} J(y)$$

For free theory, it cannot make phase transition itself.

$$\langle \phi_i \rangle = \frac{1}{i} \frac{\delta Z_0[J]}{\delta J} \Big|_{J=0} = 0$$

and

$$\begin{aligned} \langle \phi_a \phi_b \rangle &= -\frac{\delta^2 Z_0}{\delta J_a \delta J_b} \Big|_{J=0} \\ &= -\frac{\delta}{\delta J_b} \left[ (-i)(A^{-1})_{xa} e^{-\frac{i}{2} J_m (A^{-1})_{mn} J_n} \right] \Big|_{J=0} \\ &= -i(A^{-1})_{ba} = -i(A^{-1})_{ab} \end{aligned}$$

Here,  $\bar{q}_b M_{ab} q_a + J_{ab}(iq_b \bar{q}_a)$ .

Again by the same argument:

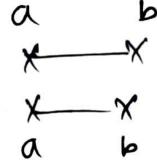

$$\langle \phi_1 \phi_2 \phi_3 \rangle = 0 \quad \text{and} \quad \langle \phi_1 \phi_2 \phi_3 \dots \phi_{n+1} \rangle = 0 \quad (\text{in } \phi^4)$$

This is not true in  $\phi^3$  theory because it is neither even nor odd.

- Fourier of even = even
- Fourier of odd = odd
- What you choose as order parameter will depend on your reality.

$$\langle \phi_a \phi_b \rangle = -i(A^{-1})_{ab} ; \quad \langle \phi_a \phi_b \phi_c \rangle = 0$$

Pictorially,

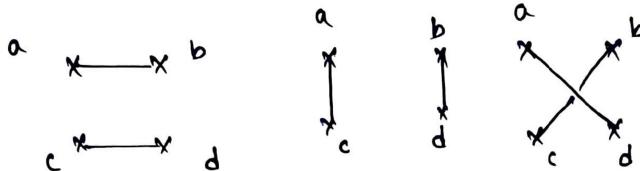

The '×' represents the source.

Now, we will calculate  $\langle \phi_a \phi_b \phi_c \phi_d \rangle$ . Recall,

$$\begin{aligned} Z[J] &= e^{-\frac{i}{2} J_x (A^{-1})_{xy} J_y} \\ &= \left. \frac{\delta^2 Z_0}{\delta J_a \delta J_b} \right|_{J=0} \quad [\text{Say } A^{-1} = V] \\ &= \left. \frac{\delta}{\delta J_b} \left( (-i) J_x V_{xa} e^{\frac{i}{2} J_m V_{mn} J_n} \right) \right|_{J=0} \\ &= -i \left[ V_{ab} e^{-\frac{i}{2} J_m V_{mn} J_n} - i V_{mb} J_m e^{-\frac{i}{2} J_m V_{mn} J_n} \times J_x V_{xa} \right] \\ &= -i [V_{ab} - (V_{mb} J_m)(V_{na} J_n)] e^{-\frac{i}{2} J_m V_{mn} J_n} \end{aligned}$$

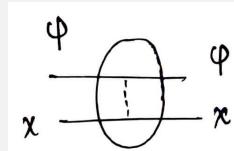

$$\begin{aligned} \langle \phi_a \phi_b \phi_c \phi_d \rangle &= \left[ (V_{cd} - V_{cm} V_{dn} J_m J_n) \times e^{-\frac{i}{2} J_\alpha V_{\alpha\beta} J_\beta} \right] \\ &= \left. \left[ V_{cd} \frac{\delta^2}{\delta J_a \delta J_b} \left( e^{-\frac{i}{2} J_\alpha V_{\alpha\beta} J_\beta} \right) - V_{cm} V_{dn} \frac{\delta^2}{\delta J_a \delta J_b} \left( J_m J_n e^{-\frac{i}{2} J_\alpha V_{\alpha\beta} J_\beta} \right) \right] \right|_{J=0} \end{aligned}$$

Exercise : Do this calculation for 6-point function and calculate  $\langle \phi_a \phi_b \phi_c \phi_d \phi_e \phi_f \rangle$

**Post class discussions:**

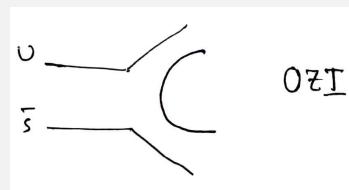

Extras: New particle finding

$$n \rightarrow p + e^- + \bar{\nu}_e \quad (\text{semi-leptonic})$$

$$K \rightarrow \pi + \pi + \pi \quad (\text{no leptonic})$$

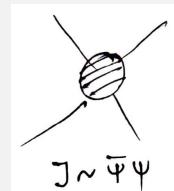

$$\mu^- \rightarrow e^- + \nu_\mu + \bar{\nu}_e \quad (\text{leptonic})$$

Here,

$$J_A J_B = J_A A + J_B A + A^n$$

$$(J_A + J_B)^n = J_A^n + J_B^n + 2J_a J_b$$

(Class-14) Lecture 11 : Sat, Aug 9, 2025

**Feynman Diagram**

In free field theory, we have

$$S = \frac{1}{2} \phi^T A \phi + J^T \phi \quad , \quad \text{condition: } A^T = A$$

Exercise: Consider a field theory for two fields  $\phi, \chi$  and whose action is given by

$$S = \frac{1}{2} \phi^T A \phi + \frac{1}{2} \chi^T A \chi + \chi^T B \phi - \phi^T B \chi \quad , \quad [B = -B]$$

Find the propagators for this field.

**What to think of QFT?**

$$\begin{array}{ccc} S & \xrightarrow{\quad} & \Gamma[\phi_c] \\ \downarrow \text{EOM} & & \downarrow \\ Z[J] = \int d\phi e^{i(S[\phi] + J \cdot \phi)} & & \frac{\delta S}{\delta \phi} \Big|_{\substack{\text{II} \\ \phi = \phi_c + \frac{i}{\hbar} \frac{\delta}{\delta J}}} = J \mathbb{I} \end{array}$$

Therefore, we can also write:

$$\frac{\delta \Gamma}{\delta \phi_c} = -J$$

The goal of QFT is to find  $\Gamma[\phi_c]$

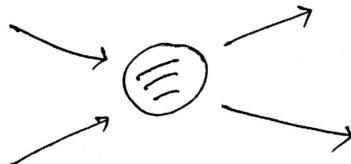

We assume “action”  $S$  by considering symmetry. There is no experimental basis beneath this. It can be assumed to be anything by considering the symmetry and it is not unique as well. Also, what we call  $\phi$  is not necessarily unique too.

**14.1 Introduction to Feynman Diagram**

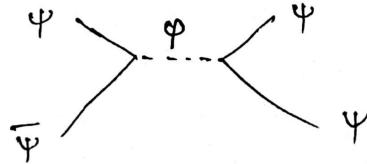

Yukawa Lagrangian:

$$\mathcal{L} = \bar{\psi}(i\partial - m)\psi + g\phi\bar{\psi}\psi + \frac{1}{2}(\partial\phi)^2 - \frac{1}{2}m^2\phi^2$$

Here, 2 incoming particles + interaction + 2 outgoing particles.

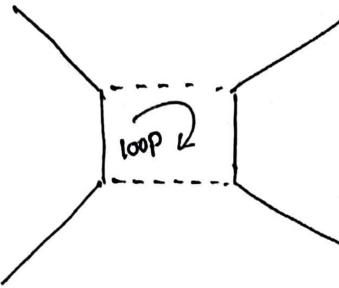

Hence, Yukawa interaction term  $g\phi\bar{\psi}\psi$  and corresponding diagram:

Tree Diagram

Note: It's not a quantum theory yet.

## 14.2 Box Diagram

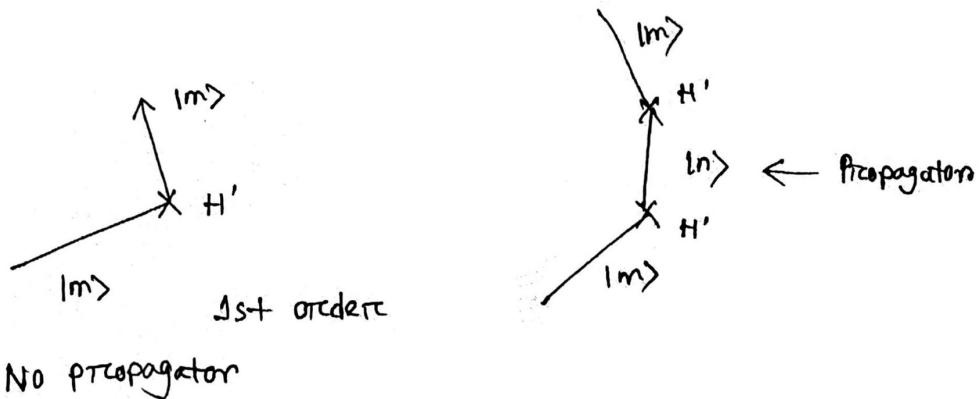

Here is one loop inside.

Now, from perturbation theory, we know:

- First order:  $\Delta E_m^{(1)} = \langle m | H' | m \rangle$
- Second order:  $\Delta E_m^{(2)} = \sum_{n \neq m} \frac{\langle m | H' | n \rangle \langle n | H' | m \rangle}{E_m - E_n}$ .

Pictorial view:

If  $E^{(1)}$  is overestimated then  $E^{(2)}$  shifts it down as:

1. The numerator is clearly positive.
2. The denominator is clearly negative.

The shift in ground state is always negative.

Now, from the eigenvalue equation:

$$\begin{aligned} \hat{H}\psi &= E\psi \quad , \quad E = H \\ \Rightarrow (\hat{H} - H)|\psi\rangle &= 0 \\ \Rightarrow (\hat{H} - H_0)|\psi\rangle &= V|\psi\rangle \quad , \quad \hat{H} = H_0 + V \end{aligned}$$

Its inverse is the propagator:  $A^{-1} \equiv \Delta$

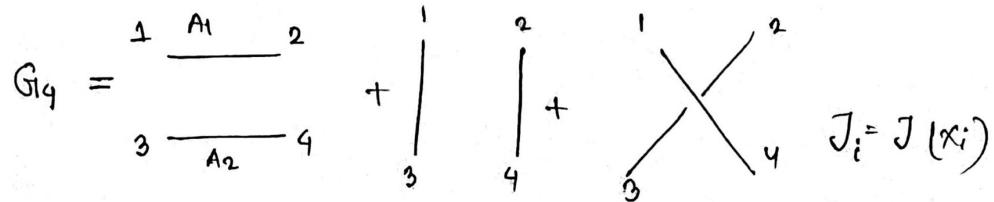

From the last class, we get:

$$Z_0[J] = Z_0[0] e^{-\frac{i}{2} J^T \Delta J}.$$

And the  $n$ -point Green function:

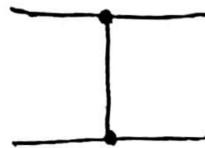

$$G_N = \frac{1}{i^N} \frac{1}{Z[0]} \left. \frac{\delta^n Z[J]}{\delta J_1 \delta J_2 \cdots \delta J_n} \right|_{J=0}.$$

Then, the 4-point Green function can be written as a pictorial view as:

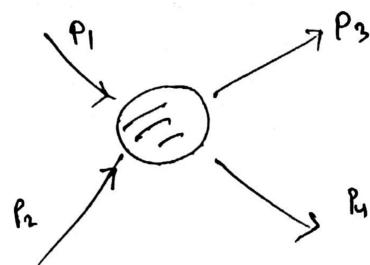

Here,  $A_1$  and  $A_2$  are the amplitudes.

These diagrams are called the *disconnected diagrams* because there is no connection or vertex between them.

An example of a connected diagram

### 14.3 Mandelstam variables

Here,  $\vec{p}_1, \vec{p}_2, \vec{p}_3, \vec{p}_4$  are the 3-vectors and hence, total number of components are  $3 \times 4 = 12$

### Analogy

The number of covariant Maxwell's equations = 2. There are two constraints:

$$\nabla \cdot \mathbf{B} = 0 \quad , \quad \nabla \cdot \mathbf{E} = \rho,$$

As both  $\mathbf{B}$  and  $\mathbf{E}$  are 3-vectors, the number of independent variables are:  $3 - 1 = 2$

Hence, total number of independent variables are:  $2 + 2 = 4$

Also, in  $2 \times 2$  scattering matrix, there are 2 independent variables.

In the center-of-mass frame, a particular Poincaré transformation has 10 independent parameters. Hence, we will eliminate 10 parameters, and the remaining independent parameters will be:  $12 - 10 = 2$ .

Now, this various relation between incoming and outgoing momenta can be considered as:

$$\begin{aligned} (p_1 + p_2)^2 &= s = (E_1 + E_2)^2 - (\mathbf{p}_1 + \mathbf{p}_2)^2 = m_1^2 + m_2^2 - 2(E_1 E_2 + \mathbf{p}_1 \cdot \mathbf{p}_2) \\ (p_1 - p_3)^2 &= t = (E_1 - E_3)^2 - (\mathbf{p}_1 - \mathbf{p}_3)^2 = m_1^2 + m_3^2 - 2(E_1 E_3 - \mathbf{p}_1 \cdot \mathbf{p}_3) \\ (p_1 - p_4)^2 &= u = (E_1 - E_4)^2 - (\mathbf{p}_1 - \mathbf{p}_4)^2 = m_1^2 + m_4^2 - 2(E_1 E_4 - \mathbf{p}_1 \cdot \mathbf{p}_4) \end{aligned}$$

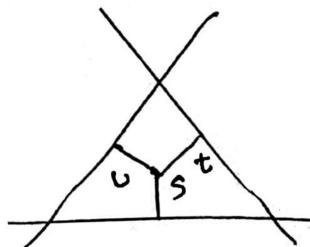

From the mass-shell (on-shell) condition  $p^2 = m^2 \Rightarrow E^2 - \mathbf{p}^2 = m^2$ , by calculation we can also find:

$$s + t + u = m_1^2 + m_2^2 + m_3^2 + m_4^2$$

In the pion case, all masses are equal, hence:

$$s + t + u = 4m_\pi^2$$

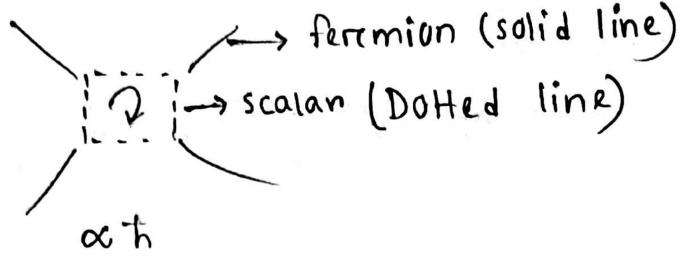

**Geometry:** In equilateral triangle,

$$s + u + v = \text{sum of the perpendicular distance} = \text{sum of total height area}$$

In free theory, only propagators exist. There is nothing beyond the propagator. Also there can also be products of propagators as well,

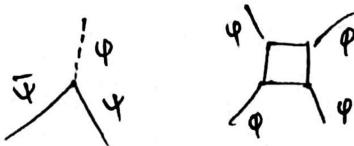

## A case for interacting theory

The order of the diagram depends on the order of  $\hbar$ .

The Lagrangian,

$$\mathcal{L} = \frac{1}{2}(\partial_\mu\phi)^2 - \frac{1}{2}m^2\phi^2 + g\bar{\psi}\psi\phi + \lambda\phi^4$$

The last term  $\lambda\phi^4$  comes from quantum (non-renormalizable) corrections. There is no classical analog of it. Some key points to remember:

- If the theories don't match the parameters, they are not renormalizable.
- Every fundamental theory should be renormalizable.
- From the partition function,

$$Z[J] = \int \mathcal{D}\phi e^{\frac{i}{\hbar}[S_0[\phi] - V(\phi) + J\phi]}$$

Here,  $V(\phi)$  is the interaction term, chosen to be polynomial. Because non-polynomial terms can be handled in  $(1+1) = 2$  dimensions.

## 14.4 A Detour of Engineering Dimension in QFT

Dimensions are measured in energy units:

$$[M] = [E] = 1, \quad [L] = [T] = \frac{1}{[M]} = \frac{1}{[E]} = -1$$

The action  $S$  is dimensionless as  $S \propto \hbar = 1$

### Bosonic Field

$$S_{\text{bosonic}} = \int d^Dx \mathcal{L}(q, \dots)$$

Here

$$[\mathcal{L}] = D, \quad [d^Dx] = -D, \quad [(\partial_\mu\phi^2)] = D \Rightarrow [\partial_\mu\phi] = \frac{D}{2} \quad \therefore [\phi] = \frac{D}{2} - 1$$

Hence,

$$\mathcal{L} = \frac{1}{2} \underbrace{(\partial_\mu\phi)^2}_{D} - \frac{1}{2} \underbrace{m^2\phi^2}_{D=2+2\left(\frac{D}{2}-1\right)} \quad (1)$$

$$D = 2 + 2\left(\frac{D}{2} - 1\right) \quad (2)$$

## Fermions

$$\mathcal{L}_D = \bar{\psi}(i\cancel{\partial} - m)\psi$$

Here we have:

$$[\bar{\psi}i\cancel{\partial}\psi] = D, \quad [\bar{\psi}\psi] = D - 1 \quad \therefore [\psi] = E^{\frac{D-1}{2}}$$

In the Yukawa term  $[G_F(\bar{\psi}\psi)^2] = D = 4$ , for  $D = 4$ :

$$[\bar{\psi}\psi] = D - 1 = 4 - 1 = 3, \quad [(\bar{\psi}\psi)^2] = 3 \times 2 = 6$$

Thus:

$$[G_F] = -6 + 4 = -2 \quad (\text{needed for } D = 4 \text{ renormalizability}).$$

## Extra Example

$$\sin(pa) = pa - \frac{(pa)^3}{3!} + \frac{(pa)^5}{5!} + \dots$$

Here  $p, a$  are both dimensionless, so it can be expanded into a series.

## Back to the Partition Function Again:

$$\begin{aligned} Z[J] &= \int \mathcal{D}\phi e^{\frac{i}{\hbar}[S_0[\phi] - V(\phi) + J\phi]} \\ &= e^{-\frac{i}{\hbar}V\left(\frac{1}{i}\frac{\delta}{\delta J}\right)} \underbrace{\int \mathcal{D}\phi e^{\frac{i}{\hbar}[S_0[\phi] + J\phi]}}_{=} \\ &= e^{-\frac{i}{\hbar}V\left(\frac{1}{i}\frac{\delta}{\delta J}\right)} \times e^{\frac{i}{2}J\Delta J} \quad [\text{Fourier transformation}] \end{aligned}$$

## Example

Potential,  $V(\phi) = \frac{\lambda}{4!}\phi^4$ . Then:

$$\begin{aligned} Z[J] &= e^{-\frac{i}{\hbar}\frac{\lambda}{4!}\frac{\delta^4}{\delta J_i^4}} \left( e^{-\frac{i}{2}J_m\Delta_{mn}J_n} \right) \\ \Rightarrow Z[J] &= \left[ 1 - \frac{i}{\hbar}\frac{\lambda}{4!}\frac{\delta^4}{\delta J_i^4} + \dots \right] \left( e^{-\frac{i}{2}J_m\Delta_{mn}J_n} \right) \end{aligned}$$

Looking at the Second Term, lets consider:

$$e^{\frac{i}{2}J_m\Delta^{mn}J_n} =$$

$$1 - \frac{i}{2} \frac{\Delta_{mn}}{J_m} \frac{\Delta_{mn}}{J_n} + \frac{1}{2!} \left( \frac{-i}{2} \right) \frac{\Delta_{mn}}{J_m} \frac{\Delta_{mn}}{J_n} + \dots$$

Now, focus on the derivative term:

$$\frac{\delta^4}{\delta J_{j_1} \dots \delta J_{j_4}} \left[ \underbrace{(J_m\Delta_{mn}J_n)}_M \underbrace{(J_p\Delta^{pq}J_q)}_N \right]$$

$$\begin{aligned}
&= \frac{\delta^3}{\delta J_i^3} \left[ 2(J_p \Delta_{pq} J_q) \frac{\partial}{\partial J_{J_i}} (J_m \Delta_{mn} J_n) \right] \\
&= \frac{\delta^3}{\delta J_i^3} [4(J_p \Delta_{pq} J_q) \Delta_{in} J_n]
\end{aligned}$$

Now:

$$\begin{aligned}
\frac{\partial}{\partial J_i} (J_m \Delta_{mn} J_n) &= \frac{\partial J_m}{\partial J_i} \Delta_{mn} J_n + J_n \Delta_{mn} \frac{\partial J_i}{\partial J_i} \\
&= \delta_{mi} \Delta_{mn} J_n + J_m \Delta_{mn} \delta_{ni} \\
&= \Delta_{in} J_n + J_n \Delta_{ni} \\
\therefore \frac{\partial}{\partial J_i} (J_m \Delta_{mn} J_n) &= 2\Delta^{in} J_n
\end{aligned}$$

Here,  $\Delta_{mn} \equiv \Delta_{nm}$  (symmetric) because  $A$  is symmetric ( $A^T = A$ ).

The derivative term  $\frac{\partial}{\partial J_i}$  amputates the propagator. That is:

$$\frac{\partial}{\partial J_i} \left( \text{loop diagram} \right) = \text{(Right)} + \text{(Left)} = 2 \text{ (single line)}$$

*(Right)*      *(Left)*

$$\frac{\partial}{\partial J_i} (\text{propagator term}) \Rightarrow \text{propagator is removed}$$

**Punchline:** Differentiating with respect to  $J$  amputates  $J$ .

## Back to the Previous Calculation

$$\begin{aligned}
&= 4 \frac{\partial^2}{\partial J_i^2} [(J_p \Delta_{pq} J_q) \Delta_{in} \delta_{in} + (\Delta_{in} J_n) \times 2\Delta_{pi} J_p] \\
&= 4 \frac{\partial^2}{\partial J_i^2} [(J_p \Delta_{pq} J_q) \Delta_{ii} + 2\Delta_{pi} \Delta_{ni} J_n J_p] \\
&= 4 \frac{\partial}{\partial J_i} \left[ \frac{\partial}{\partial J_i} (J_p \Delta_{pq} J_q) \Delta_{ii} + 2\Delta_{pi} \Delta_{ni} \frac{\partial}{\partial J_i} (J_n J_p) \right] \\
&= 4 \frac{\partial}{\partial J_i} [(2\Delta_{iq} J_q) \Delta_{ii} + 2\Delta_{pi} \Delta_{ni} (J_n \delta_{pi} + J_p \delta_{ni})] \\
&= 4 [2\Delta_{iq} \delta_{iq}] + 4[2\Delta_{pi} \Delta_{ni}] \frac{\partial}{\partial J_i} (J_n \delta_{pi} + J_p \delta_{ni}) \\
&= 8\Delta_{ii} + 8\Delta_{pi} \Delta_{ni} (\delta_{ni} \delta_{pi} + \delta_{ni} \delta_{pi}) \\
&= 8A_{ii} + 8 \times 2 \Delta_{ni} \Delta_{ni} \\
&= 24\Delta_{ii} \Delta_{ii} = 4! \Delta_{ii} \Delta_{ii}
\end{aligned}$$

The  $4!$  arises due to the term  $\frac{\lambda}{4!} \phi^4$  where a  $4!$  term was present in the denominator.

## Pictorial view

1.  $\Delta_{ii}$  = self-interacting term = generates loop.

$$\frac{m}{\partial j_i} \left[ \begin{array}{c} x \xrightarrow{\hspace{1cm}} x \\ \uparrow \quad \quad \quad \uparrow \end{array} \right] \quad = \quad \text{Creation of a loop}$$

Amputated

2.  $\Delta_{ii}\Delta_{ii}$  term corresponds to connecting two vertices, giving additional loop contributions.

$$\frac{\partial^4}{\partial j_i^4} \left( \begin{array}{c} x \rightarrow x \\ x \rightarrow x \end{array} \right) \equiv \begin{array}{c} i \\ \circ \\ i \end{array} = A_{ji} A_{ii}$$

Amputated at  
this point

Here

$\lambda \Phi^4 \rightarrow$

Connect it to any point, 3 choices  
only left = 2 choices

$$= 4 \times 3 \times 2 \times 1 = 4!$$

I can choose any points = 4 choices

Free theory generates only tree graphs. Sequential diagrams of the partition function due to the potential ( $V = \frac{\lambda}{4!}\phi^4$ ) contain disconnected diagrams as well.

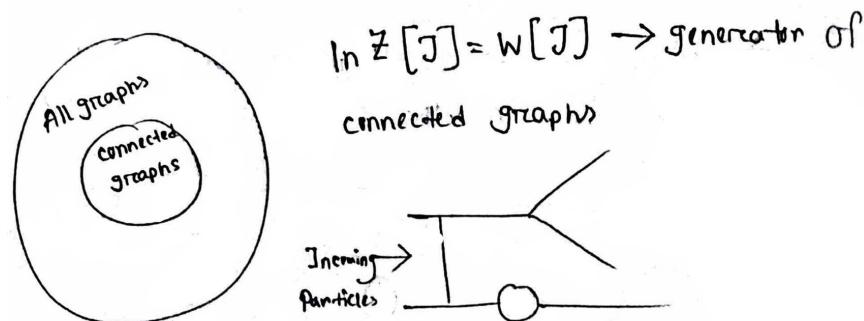

### + Disconnected Diagrams

Therefore:

$$\Gamma \equiv \cdot + \frac{\hbar}{i} \mathcal{O} + \left( \frac{\hbar}{\ell} \right)^n \left[ \frac{1}{12} \delta + \frac{1}{8} \theta + \mathcal{B}^+ \right]$$

Lessons:

1. Quadratic (free theory) generates only tree graphs.
2. Interaction leads to loops.
3.  $Z[J]$  generates all graphs, including disconnected graphs.

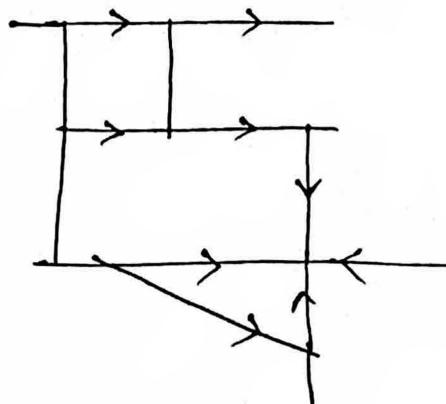

**Exercise:** For  $V = \frac{g\phi^3}{3!}$ , Calculate the 2<sup>nd</sup> order contribution to  $Z[J]$  due to this interaction

Connected graph = product of disconnected graphs.

This is the only connected graph in free theory

## Post-class discussion:

Free choices of momentum in a loop:

$$I = \text{No. of internal lines (not function of } p\text{)}$$

$$V = \text{No. of vertices (No. of linear equations)}$$

There is a constant in the diagram (momentum conservation), hence at vertex:  $V - 1$ .

$$\Rightarrow \text{Free choices: } I - (V - 1) = I - V + 1$$

Trick:  $\hbar^n$ , where  $n = \text{number of loops in the diagram.}$
